the Arizona Corporation Commission.

1 BE IT REMEMBERED that the above-entitled and
2 numbered matter came on regularly to be heard before the
3 Arizona Corporation Commission, in Hearing Room 1 of
4 said Commission, 1200 West Washington Street, Phoenix,
5 Arizona, commencing at 9:06 a.m. on the 6th of May,
6 2016.

7
8 BEFORE: TEENA JIBILIAN, Assistant Chief Administrative
Law Judge

9
10 Note: No roll call taken. The following is a list
of the parties of record.

11 PARTIES OF RECORD:

12 For Arizona Public Service Company:

13 PINNACLE WEST CAPITAL CORPORATION
14 Law Department
By Mr. Thomas Loquvam
15 400 North Fifth Street
Phoenix, Arizona 85004

16 and

17 SNELL & WILMER, L.L.P.
18 By Mr. Raymond S. Heyman
400 East Van Buren
19 Phoenix, Arizona 85004

1 PARTIES OF RECORD:

2 For Tucson Electric Power Company and UNS Electric,
3 Inc.:4 SNELL & WILMER, L.L.P.
5 By Mr. Michael W. Patten
6 400 East Van Buren
7 Phoenix, Arizona 85004

8 and

9 UNS ELECTRIC, INC.
10 By Mr. Bradley S. Carroll
11 88 East Broadway Boulevard
12 Tucson, Arizona 85701

13 For The Alliance for Solar Choice:

14 ROSE LAW GROUP, P.C.
15 By Mr. Court S. Rich
16 7144 East Stetson Drive, Suite 300
17 Scottsdale, Arizona 85251

18 For Arizona Investment Council:

19 OSBORN MALEDON
20 By Ms. Meghan H. Grabel
21 2929 North Central Avenue, 21st Floor
22 Phoenix, Arizona 85012

23 For Western Resource Advocates, Vote Solar:

24 ARIZONA CENTER FOR LAW IN THE PUBLIC INTEREST
25 By Mr. Timothy Hogan
202 East McDowell Road, Suite 153
Phoenix, Arizona 85004

1 PARTIES OF RECORD:

2 For Garkane Energy Cooperative, Inc.; Mohave Electric
3 Cooperative, Inc.; and Navopache Electric Cooperative,
Inc.:

4 LAW OFFICES OF WILLIAM P. SULLIVAN, P.L.L.C.
5 By Mr. William P. Sullivan
6 501 East Thomas Road
Phoenix, Arizona 85012

7 For Sulphur Springs Valley Electric Cooperative, Inc.:

8 CROCKETT LAW GROUP, P.L.L.C.
9 By Mr. Jeffrey W. Crockett
2198 East Camelback Road, Suite 305
Phoenix, Arizona 85016

10

11 For Arizona Solar Deployment Alliance:

12 LAW OFFICES OF GARRY D. HAYS, P.C.
13 By Mr. Garry D. Hays
2198 East Camelback Road, Suite 305
Phoenix, Arizona 85016

14

15 For Freeport Minerals Corporation and Arizonans for
16 Electric Choice and Competition:

17 FENNEMORE CRAIG, P.C.
18 By Mr. C. Webb Crockett
2394 East Camelback Road, Suite 600
Phoenix, Arizona 85016

19

20 For Grand Canyon State Electric Cooperative Association,
Inc.:

21 GALLAGHER & KENNEDY, P.A.
22 By Ms. Jennifer Cranston
2575 East Camelback Road
Phoenix, Arizona 85016

23

24

25

1 PARTIES OF RECORD:

2 For IBEW Locals 387, 1116 and 769:

3 LUBIN & ENOCH, P.C.
4 By Mr. Nicholas J. Enoch
349 North Fourth Avenue
Phoenix, Arizona 85003

5

6 For Arizona Competitive Power Alliance:

7 Mr. Greg Patterson, Of Counsel
MUNGER CHADWICK
8 916 West Adams, Suite 3
Phoenix, Arizona 85007

9

10 For Arizona Solar Energy Industries Association:

11 AriSEIA
Mr. Tom Harris
12 2122 West Lone Cactus Drive, Suite 2
Phoenix, Arizona 85027

13

14 For Patricia C. Ferre:

15 Patricia C. Ferre
In Propria Persona, via teleconference
16 P.O. Box 433
Payson, Arizona 85547

17

18 For Vote Solar:

19 EARTHJUSTICE
By Mr. Michael A. Hiatt
20 633 17th Street, Suite 1600
Denver, Colorado 80202

21

22 For the Residential Utility Consumer Office:

23 RUCO
By Mr. Daniel W. Pozefsky, Chief Counsel
24 1110 West Washington Street, Suite 220
Phoenix, Arizona 85007

25

1 PARTIES OF RECORD:

1 ACALJ JIBILIAN: Good morning, and welcome back,
2 everyone, to the continuation of this proceeding. I am
3 not going to take appearances today. I can see who is
4 here.

5 So we will just go ahead and start with TASC's
6 witness. Are you ready to call your witness, Mr. Rich?

7 MR. RICH: Yes, Your Honor. Thank you. Good
8 morning. TASC calls R. Thomas Beach.

9
10 R. THOMAS BEACH,
11 called as a witness on behalf of TASC, having been first
12 duly sworn by the Certified Reporter to speak the truth
13 and nothing but the truth, was examined and testified as
14 follows:

15

16 DIRECT EXAMINATION

17 BY MR. RICH:

18 Q. Great. Good morning, Mr. Beach.

19 A. Good morning.

20 Q. All right. You should have before you what have
21 been marked as TASC Exhibits 26, 27, and 28. Do you see
22 those up there?

23 A. Yes, I do.

24 Q. Okay. And can you identify each of those for
25 us?

1 A. TASC-26 is my direct testimony in this docket.
2 TASC-27 is my rebuttal testimony. And TASC-28 are some
3 errata corrections to my 2, Exhibit 2 to my direct
4 testimony.

5 Q. Okay, great. Let's start with Exhibit 26, your
6 direct testimony. Was that prepared by you or at your
7 direction?

8 A. Yes, it was.

9 Q. Okay. And if you were to be asked those same
10 questions today under oath, would the responses be the
11 same?

12 A. Yes, they would.

13 Q. Okay. And are there any other, you mentioned
14 the errata that's contained in Exhibit 28, are there any
15 other changes or corrections that you need to make to
16 that today?

17 A. Yes. There is one minor correction in Exhibit 2
18 of my direct testimony, which is the benefit/cost study
19 on APS that we conducted. Table 4 on page 12, there is
20 a page reference that's missing. If you look in Table 4
21 in the line that's labeled capacity losses in the first
22 column, and then the value is 11.7 percent, and the
23 notes in the, and sources in the third column, it says
24 SAIC study at and then there is a blank there, that
25 should be page 2-9.

1 Q. Okay. And that's in Exhibit 2 to your direct
2 testimony on page 12, correct?

3 A. Yes.

4 Q. All right. On the version that's in front of
5 you, would you mind, I guess, let's just have you write
6 in the correct, fill in that blank if you have a pen
7 there.

8 A. Okay.

9 Q. Then you can just initial next to it. All
10 right. And I will, we will move them all at once.

11 Let me ask you on Exhibit 27, your rebuttal
12 testimony, was that prepared by you or at your
13 direction?

14 A. Yes, it was.

15 Q. Okay. And do you have any changes to make to
16 that document today?

17 A. No, I don't.

18 Q. All right. And would your answers to that, to
19 those questions that were asked there be the same today
20 under oath as they were when you submitted it?

21 A. Yes, they would.

22 Q. Okay. And finally, with regard to Exhibit 28,
23 was that notice of errata filing done at your direction
24 and do you agree with those changes that are made and
25 reflected in that filing?

1 A. Yes, I do.

2 MR. RICH: Okay. Great.

3 Your Honor, I would move the admission of
4 TASC-26, 27, and 28.

5 ACALJ JIBILIAN: Is there any objection?

6 (No response.)

7 ACALJ JIBILIAN: TASC-26, 27, and 28 are
8 admitted.

9 (Exhibit TASC-26 through TASC-28 were admitted
10 into evidence.)

11 BY MR. RICH:

12 Q. Okay. Great. Thank you.

13 So Mr. Beach, I am going to give you an
14 opportunity to summarize your direct and rebuttal
15 testimony and respond to some of what you heard from the
16 stand. So if you would like to do that, please go
17 ahead.

18 A. Yes. Thank you very much for the opportunity to
19 appear today.

20 My testimony proposes a benefit/cost methodology
21 for valuing DG resources that builds upon the widely
22 used industry standard approach to assessing the cost
23 effectiveness of other types of demand-side resources,
24 such as energy efficiency and demand response. The
25 primary reason to use a similar approach is so that all

1 demand-side resources, distributed generation as well as
2 energy efficiency and demand response, are evaluated on
3 the same basis.

4 Importantly, this approach also evaluates
5 demand-side resources in a manner similar to supply-side
6 utility rate base additions. This approach considers
7 the long-term benefits and costs of DG resources over
8 their full expected life in the same way that other new
9 resources are evaluated. These benefit/cost analyses
10 assess the benefits and costs of DG from multiple
11 perspectives, including, first, participating ratepayers
12 who install DG, second, other nonparticipating
13 ratepayers, and, third, the utility system and society
14 as a whole.

15 The goal of the regulator should be to balance
16 the interests of all of these stakeholders, who
17 collectively constitute the public interest in the
18 development of renewable DG technologies. In
19 particular, demand-side resources depend on the
20 decisions of customers to make long-term investments to
21 reduce their energy use, shift their loads or produce
22 their own generation. So it is critical to balance the
23 interests of both participating and nonparticipating
24 ratepayers and not to favor either side.

25 The utility witnesses have testified in this

1 hearing that customer-sited DG should not be treated as
2 a demand-side resource at all but that, instead, their
3 own customers who install DG should be treated more like
4 the owners of merchant generation facilities. They
5 argue that the fact that DG has differences from energy
6 efficiency or demand response resources mean that it
7 cannot be treated like energy efficiency or demand
8 response. This ignores that there is a wide variety of
9 efficiency and demand resource product and services that
10 differ from each other. For example, some reduce energy
11 use, others reduce peak loads. And cost effectiveness
12 evaluation can be tailored to the particular type of
13 energy efficiency and demand response resource. And
14 they can also be adapted for distributed generation.

15 Despite the differences in these other
16 demand-side options, DG is the only one that the
17 utilities argue must be evaluated differently. The
18 utilities have tried to shift the focus from customers
19 adopting DG to the companies who sell or finance DG
20 products. This makes little sense and appears to be an
21 attempt by the utilities to misdirect the Commission.

22 For example, Home Depot no doubt sells many
23 energy efficient heat pumps as a result of the
24 residential rate design in Arizona, but the utilities do
25 not claim that Home Depot is profiting off the current

1 rate design or raising rates for nonparticipating
2 customers. Remember, it is the individual customers who
3 are making the decisions to install those heat pumps,
4 just like it is the individual solar customers who are
5 installing DG.

6 The fact that nonutility customers compete to
7 provide these products and services is a distraction
8 raised by the utilities when the focus should be on the
9 utility costs which can be reduced when customers choose
10 all types of demand-side resources.

11 Distributed generation, like energy efficiency,
12 is implemented on a customer's premises as a result of a
13 customer's decision to deploy their own private capital
14 and they pay the capital costs.

15 In sum, all demand-side resources, including DG
16 should be judged using the well established methodology
17 now used for energy efficiency and demand response.

18 Several of the utility parties have urged the
19 Commission to use cost of service studies to assess the
20 cost effectiveness of renewable DG. Cost of service
21 studies are based on utility costs in only a single test
22 year and thus fail to capture the full benefits and
23 costs of renewable DG over the long-term life of these
24 resources. A cost of service study is based on embedded
25 costs, not on the utility's long-run marginal costs and,

1 thus, is likely to underestimate the long-run costs
2 avoided by renewable DG, particularly the avoided
3 capacity costs for generation, transmission, and
4 distribution.

5 Regulators do not use cost of service studies to
6 judge the cost effectiveness of other types of resources
7 and do not use them to judge the merits of utility owned
8 resources. If a cost of service were used for the
9 purpose of judging a utility owned resource, those
10 resources often would fail because cost recovery through
11 rate base is front loaded to the early years of a
12 plant's life, and, thus, new utility owned resources
13 often raise rates in the first rate case after they
14 enter service even if they are cost effective on a
15 lifecycle basis.

16 I would like to clear up some misconceptions
17 about benefit/cost studies of renewable DG. The intent
18 of these studies is not to set rates. It is to balance
19 the benefits and costs of DG technologies. Obviously
20 rates and rate design impact this balance because the
21 primary costs of net metering for nonparticipating
22 ratepayers are the lost revenues from running the meter
23 backwards at the retail rate. These same lost revenues
24 are the bill savings that are the primary benefit of DG
25 for participating ratepayers.

1 So benefit/cost tests are not setting rates but
2 you can affect the balance of benefits and costs for the
3 two groups by making rate design changes. If the
4 Commission concludes that rate design changes are
5 necessary to adjust this balance in Arizona, the types
6 of changes that the Commission should prioritize are,
7 first, requiring the use of time-of-use rates that
8 better reflect how utility costs vary through the day
9 or, second, adopting minimum bills, which continue to
10 allow the greatest scope for customers to exercise the
11 choice to adopt DG.

12 Fixed charges should be avoided because they
13 give the customer no economic signal to use energy
14 wisely. And demand charges should also be avoided
15 because a customer's highest 15-minute demand does not
16 necessarily align with peak demands at either the
17 circuit or system level. And demand charges are
18 confusing to and poorly accepted by small customers.

19 The Commission should take care to design rates
20 that are understandable and acceptable to customers,
21 recognizing the future potential that customers who use
22 DG and storage may be able to cut the cord with the
23 utility system completely, which is an outcome that I
24 think we all want to avoid.

25 Despite the urging of the utilities, DG

1 customers should not be placed into their own rate
2 class. On this we firmly agree with Staff that it makes
3 little sense to start down the road of creating separate
4 customer classes for every new energy technology that
5 customers adopt. Mr. Monsen has a detailed discussion
6 of this issue in his testimony and he shows that other
7 demand-side technologies also can produce significant
8 changes in customers' load profiles as can DG.

9 Basically DG makes a larger than average residential
10 customer into a smaller than average one. But both
11 before and after adding DG, their use is within the
12 typical range for residential customers.

13 The parties to this case agree on many of the
14 benefits and costs of renewable DG. Two of the benefits
15 on which there is not agreement are fuel hedging and
16 market price mitigation. On fuel hedging, it should be
17 obvious that solar DG like other types of renewable
18 generation displaces marginal use of natural gas to
19 produce electricity and, thus, reduces the amount of
20 natural gas burned by the utility, decreasing its volume
21 of gas purchases that are subject to price volatility.
22 That's how renewables provide a hedge, and the value of
23 this hedge is not zero.

24 With respect to market price mitigation, what
25 that means is simply that the increase in renewable

1 generation in the western U.S. and Arizona with zero
2 variable cost will reduce wholesale market prices in
3 this region as it has in places like Germany that have
4 high penetrations of renewables. You may be aware that
5 in a few hours today the amount of renewable output in
6 California depresses market prices to below zero to the
7 benefit of utilities who are paid to take this power,
8 utilities in Arizona, for example, who are paid to take
9 this power. So any utility that purchases wholesale
10 power or natural gas will benefit from the lower prices
11 that result from renewable deployment.

12 With respect to the Seidman study of the
13 economic impacts of renewable DG, this study is flawed
14 as a result of the assumptions that APS provided for
15 Arizona State. I understand that APS has indicated it
16 is not submitting the report into evidence to prove the
17 truth of the matters contained in the report, which is a
18 good thing, because of these flaws. In terms of the
19 flaws there are four major ones.

20 First, APS's scenarios assume that DG located at
21 the point of end use would have no effect on its future
22 investment in transmission and distribution
23 infrastructure. However, most other parties to this
24 proceeding recognize that avoided T&D is a benefit of
25 distributed generation.

1 APS assigns, the second flaw, APS assigns a
2 capacity value to solar that is far too low given the
3 output of solar over the utility's peak hours.

4 Furthermore, any decline in solar's capacity value with
5 increasing penetration can be slowed or reversed with
6 west-facing systems and a modest amount of storage.

7 APS's work papers show that the utility assumed
8 that the federal investment tax credit is not extended
9 when in fact it has been extended at the 30 percent
10 level. This is the third flaw in the assumptions. As a
11 result, additional solar investment in Arizona will
12 benefit the state much more than the Seidman study has
13 estimated because most of the costs will be borne by
14 taxpayers in other states.

15 And fourth and finally, the Seidman study does
16 not consider the broad economic benefits for the State
17 of Arizona if businesses in Arizona leverage the state's
18 leadership position in solar technologies, its abundant
19 solar resources and its local expertise to serve markets
20 to distributed renewable resources outside of Arizona.
21 California now has more solar workers than utility
22 employees. The reason for this is not just because the
23 state has half a million DG installations but because
24 the solar industry is serving solar markets in the rest
25 of the U.S. and around the world.

1 APS's rebuttal criticizes our exemplary
2 benefit/cost study for APS for looking at the entire
3 output of DG facilities instead of just looking at DG
4 exports. Let me be clear. We agree that the focus of
5 the methodology adopted by this proceeding should be the
6 value of exports, because DG customers have a right
7 under PURPA to serve their own on-site loads with their
8 own renewable DG systems and to export excess energy to
9 the utility. However, as a technical matter of doing
10 the calculations, valuing only the exports is more
11 difficult because you need to do the analysis on an
12 hourly basis, considering both the hourly DG output and
13 hourly loads of the DG customer to determine when the
14 exports occur.

15 We suggest that valuing the full output is an
16 easier alternative. And the studies in California that
17 have looked at the value of both exports alone and all
18 output have not found a significant difference between
19 the two. I will note that Mr. Snook's cost of service
20 testimony valued all DG output as did the two prior DG
21 solar cost effectiveness studies that APS has
22 commissioned. So in the past, when APS has had to do
23 these calculations, it has also looked at all output.
24 So to be clear, we are not opposed to valuing just the
25 exports, but the Commission should be aware that this

1 will complicate the analysis probably for little
2 benefit.

3 Finally, this case includes comparisons between
4 the costs of utility scale and rooftop solar systems.
5 Utility scale solar has lower capital costs as a result
6 of economies of scale. However, despite the claims of a
7 few parties in this proceeding, this is not a simple
8 apples to apples comparison because the two types of
9 solar do not provide the same product. Rooftop solar
10 provides a retail product while utility scale solar
11 provides a wholesale product.

12 The retail rooftop product has been delivered to
13 load whereas the wholesale utility scale product has
14 not. Thus, for a fair comparison between the two
15 resources, at a minimum one must add to the cost of
16 utility scale solar the marginal cost associated with
17 delivering this power to the customers that can be
18 served by solar DG located on their own roofs.

19 In addition, there is nothing in APS's 2014 IRP
20 or its draft 2017 IRP which indicates that rooftop and
21 utility scale solar are substitutes for each other. So,
22 if APS installs less rooftop solar, it is not committing
23 to installing more utility scale solar, or vice versa.

24 Mr. Snook's testimony assumes that exports from
25 DG solar avoid APS's marginal fuel, which is natural

1 gas. There is no renewable energy standard requirement
2 which requires the substitution of utility scale to
3 rooftop solar as APS is in compliance with the REST
4 goals. And in any event, there is a set-aside for DG
5 solar that utility scale solar cannot satisfy.

6 Rooftop solar provides additional benefits to
7 the local environment and the local economy that utility
8 scale solar does not, as is discussed in my APS
9 benefit/cost study.

10 Finally, there are important policy reasons to
11 treat rooftop solar equitably so consumers continue to
12 have the freedom to exercise a competitive choice and to
13 become more engaged in and reliant in providing for
14 their energy needs.

15 Thank you.

16 MR. RICH: Great. Thank you, Mr. Beach.

17 I will tender Mr. Beach for cross-examination at
18 this time.

19 ACALJ JIBILIAN: Thank you.

20 Mr. Hogan, do you have questions for this
21 witness?

22 MR. HOGAN: I do not, no.

23 ACALJ JIBILIAN: Mr. Enoch.

24

25

1 CROSS-EXAMINATION

2 BY MR. ENOCH:

3 Q. Good morning, Mr. Beach.

4 A. Good morning.

5 Q. Can you take a look at your TASC Exhibit 26.

6 What is the date of that?

7 A. February 25th.

8 Q. Okay. Can you turn to page 7. Question 10, you
9 make the comment starting at line 30 -- can you read
10 that sentence for me.

11 A. Even though the Public Utility Commission of
12 Nevada has subsequently decided to phase in the new DG
13 rates over a 12-year period, the elimination of net
14 metering, and in particular the reduction in the export
15 rate, has decimated the rooftop solar market in Nevada
16 resulting in more than a thousand documented layoffs at
17 solar companies.

18 Q. And in support of that proposition you cite to
19 your own testimony down below that you filed in the
20 docket of the Public Utility Commission of Nevada,
21 correct?

22 A. Yes.

23 Q. Okay. Can we take a look at APS Exhibit 11.

24 MR. RICH: Does the witness have that? What is
25 that?

1 MR. ENOCH: APS Exhibit 11 is the decision,
2 modified final order from the Public Utility Commission
3 of Nevada.

4 BY MR. ENOCH:

5 Q. Is that what you are looking at, Mr. Beach?
6 Could you turn -- well, actually, the last page of this
7 document, if you just flip it over, page 183, this is
8 dated February 17th, 2016, correct?

9 A. Yes.

10 Q. Okay. Now, let's turn back a few pages to
11 page 179, paragraph 404. Can you read that paragraph
12 for me, Mr. Beach, paragraph 404.

13 A. The information and testimony presented by Staff
14 regarding the employment figures for Nevada's solar
15 industry indicates that the figures cannot be reasonably
16 relied upon as an estimate of the number of solar jobs
17 in Nevada or the number of jobs that could potentially
18 be impacted by this order. Further, no corroborating
19 information from other sources was identified. No party
20 to this proceeding provided any material support for the
21 notion that a change in the NEM rates and tariffs would
22 result in the loss of nearly 6,000 solar jobs. TASC and
23 SEIA's objections to providing information that would
24 help confirm or refute the figures for rooftop solar
25 jobs in Nevada are perplexing.

1 Q. Okay. Should I assume that you don't agree with
2 that finding from the Nevada Public Utility Commission?

3 A. No. My recollection of what happened in that
4 case is there was some debate earlier in the proceeding,
5 there was a debate about how many solar jobs there are
6 in the Nevada. And that's the reference to the 6,000
7 solar jobs that's at the top of page 180. But the job
8 losses that I documented in my testimony on
9 grandfathering, which is what I am referring to in my
10 testimony here, about the thousand job losses, that was
11 very well documented.

12 We had, you know, notices that have been sent to
13 the State of Nevada. You have to notify the state when
14 you do layoffs. And so I basically just tallied up all
15 the layoff notices that had been provided to the State
16 of Nevada about the thousand layoffs.

17 Q. And assumed that those were the result of the
18 changes in the net metering?

19 A. They were.

20 Q. Well, how do you know that?

21 A. Well, they occurred shortly after the Commission
22 issued its order.

23 Q. So it follows that that is the result, on that
24 shorter notice --

25 A. I'm --

1 Q. -- for the -- let me finish the question.

2 You took the notices for the mass layoff and you
3 assumed that that was a consequence of a regulatory
4 change by the Public Utility Commission in Nevada,
5 correct? That's an assumption?

6 A. It was more than an assumption because a lot of
7 the solar companies also issued press releases saying
8 that's why the layoffs were occurring.

9 Q. Okay. Whatever the case may be, you would agree
10 that Public Utility Commission of Nevada found that
11 whole line of inquiry to be unsubstantiated? I don't
12 want to put words in their mouth, but in section 404,
13 they didn't agree with you.

14 A. I think I have already explained that that was
15 about another issue. That was about how many total
16 solar jobs there were in Nevada to begin with.

17 Q. Does this Public Utility Commission -- this is
18 an 183-page decision. To the best of your recollection,
19 does it have anything in there where it adopts that
20 portion of your testimony in Nevada?

21 A. I would have to look at it. I don't know.

22 Q. If I represented to you that I have read it and
23 I didn't see anything along those lines, would you have
24 any reason to disagree with me?

25 MR. RICH: Your Honor, I am going to object.

1 Mr. Beach's testimony is about the impact of the
2 decision in Nevada, not about what is in the order that
3 implemented the decision in Nevada. And I think that's
4 an important distinction.

5 BY MR. ENOCH:

6 Q. I think the point I am trying to make is you
7 have a decision that came down on the 17th of
8 February and then, correct me, a few days later you then
9 filed testimony here and you don't mention that? Or do
10 I have the sequence wrong?

11 A. I will agree that I filed my testimony here
12 after this order came out.

13 MR. ENOCH: Okay. I have nothing else. Thank
14 you.

15 ACALJ JIBILIAN: Ms. Grabel.

16 MS. GRABEL: Thank you, Your Honor.

17

18 CROSS-EXAMINATION

19 BY MS. GRABEL:

20 Q. Good morning, Mr. Beach.

21 A. Good morning.

22 Q. The document that you have in front of you, is
23 it dated February 25th, 2016 and has a signature by
24 Court Rich on the bottom of it? Is that correct?

25 A. Yes.

1 Q. I just noticed, and for your information, you
2 might want to correct it, I think it says filing direct
3 testimony of B. Thomas Beach. And that is not your
4 correct initials, correct?

5 A. That is an error, yes.

6 Q. You would correct it to R. Thomas Beach?

7 A. Yes.

8 Q. In your opening I believe that you mentioned
9 that California has more solar employees because the
10 solar industries are installing systems elsewhere in the
11 country, is that correct?

12 A. Yes, many companies based in California do a lot
13 of business elsewhere.

14 Q. So the industries that you were referring to are
15 those that were based in California?

16 A. Yes.

17 Q. Would you agree with me that the distributed
18 generation customer sells energy to the utility?

19 A. Yes.

20 Q. And the utility sells it to the end user?

21 A. Yes.

22 Q. Thank you.

23 Mr. Beach, you worked from 1981 through 1989 at
24 the California power utilities commission, is that
25 right?

1 A. It is the Public Utilities --

2 Q. Public Utility.

3 A. -- Commission.

4 Q. Thank you.

5 And from there you established a private
6 consulting practice with Crossborder Energy, correct?

7 A. Yes.

8 Q. You held no other jobs between your position on
9 the CPUC and your current consulting practice
10 Crossborder, is that right?

11 A. That's correct.

12 Q. And Crossborder Energy is based in Berkeley,
13 California?

14 A. Yes.

15 Q. You mentioned in your testimony that you have
16 actively participated in most of the major energy policy
17 debates in California, including renewable energy
18 development, is that right?

19 A. Yes.

20 Q. In fact, I looked at your CV. It identifies 84
21 matters on which you testified in California compared to
22 a total of 16 matters about which you have testified
23 elsewhere. Does that sound about right?

24 A. Well, I don't update my CV -- I update it about
25 once a year. And recently I have been testifying

1 outside of California much more than I have inside of
2 California. So it is -- that's right. I have testified
3 in California more than I have in other states, but I
4 have been traveling a lot recently.

5 Q. Do you think you traveled enough to add 60 more
6 matters outside of California to your resumé?

7 A. Not 16, but --

8 Q. 60, I said.

9 A. No.

10 Q. Have you ever worked for a utility?

11 A. Yes.

12 Q. Directly for a utility?

13 A. You mean as an employee?

14 Q. Yes.

15 A. No. I have consulted for a number of utilities,
16 though.

17 Q. Have you ever consulted for any investor-owned
18 utilities?

19 A. Yes.

20 Q. Which utilities?

21 A. Pacific Gas & Electric.

22 Q. In what matter?

23 A. If you look at my CV, it is the first time I
24 filed testimony as a private consultant. I was
25 testifying on behalf of PG&E and its FERC regulated

1 interstate pipeline affiliate.

2 Q. And what year was that?

3 A. That was, I think it was 1989.

4 Q. Have you testified for a public utility after
5 1989?

6 A. No, I have not.

7 Q. Have you ever worked for a utility in utility
8 system operations?

9 A. No.

10 Q. You never worked in a utility system planning
11 department?

12 A. No.

13 Q. Do you own a home in California?

14 A. Yes.

15 Q. Totally out of curiosity, do you have solar
16 panels?

17 A. I have had solar panels since 2003.

18 Q. You have testified before for the Solar
19 Alliance, is that correct?

20 A. Yes.

21 Q. And the Solar Energy Industries Association?

22 A. Yes.

23 Q. You have testified for Vote Solar?

24 A. Yes.

25 Q. And you are testifying today on behalf of The

1 Alliance for Solar Choice, correct?

2 A. That's correct.

3 Q. And you have done work previously for TASC,
4 correct?

5 A. Yes.

6 Q. How much of your work in the past five years has
7 been commissioned by solar advocacy groups?

8 A. In the last five years, I, you know, I don't
9 know the exact amount, but I would say maybe 30 percent.

10 Q. I would like to show you AIC Exhibit No. 8. I
11 believe you have all the AIC exhibits in front of you.

12 And, Your Honor, I gave you some as well over by
13 that water jug again.

14 A. Okay.

15 MS. GRABEL: One second.

16 (Brief pause.)

17 BY MS. GRABEL:

18 Q. Would you please turn to page 2 of AIC
19 Exhibit 8.

20 A. All right.

21 Q. This article announces the formation of The
22 Alliance for Solar Choice and it appeared on the
23 American Solar Energy Society website on May 13th, 2013.
24 Do you see that?

25 A. Yes.

1 Q. If you would look at page 2, the third sentence
2 below the paragraph, I mean below the photograph, I am
3 sorry, what solar companies are listed as the founding
4 members of The Alliance for Solar Choice? You see they
5 are identified in red.

6 A. SolarCity, Sungevity, Sunrun, and Verengo.

7 Q. Thank you.

8 I would now like to turn to AIC Exhibit 9.

9 A. All right.

10 Q. Hold on. I have got to give them to everybody
11 else.

12 (Brief pause.)

13 BY MS. GRABEL:

14 Q. AIC Exhibit 9, as you will see, is a copy of the
15 intervention of The Alliance for Solar Choice for leave
16 to intervene in the Tucson Electric Power rate case. Do
17 you see that?

18 A. Yes.

19 Q. The Alliance for Solar Choice did not intervene
20 recently in this docket. This is the most recent
21 intervention request dated March 3rd, 2016.

22 Would you please read for me the companies that
23 TASC lists as its member companies on this document.
24 You will find them in paragraph 2?

25 A. Demeter Power Group, Geostellar Inc., LGCY

1 Power, REPOWER by Solar Universe, Sunrun Inc., and Sun
2 Time Energy.

3 Q. Would you agree that of the original founding
4 members of TASC that we looked at on AIC Exhibit 8 only
5 Sunrun remains as a listed member according to TASC's
6 most recent intervention request?

7 MR. RICH: Your Honor, Mr. Beach is not a direct
8 employee of TASC. And I am not sure he has personal
9 knowledge with regard to who are members and who are
10 not.

11 MS. GRABEL: Mr. Rich, I am asking him to opine
12 based on documents that TASC filed. And you haven't put
13 any employee of TASC on the stand, so I have no other
14 opportunity to ask a question of TASC.

15 ACALJ JIBILIAN: Overruled.

16 MR. RICH: Your Honor, just for the record, the
17 members of TASC for the purposes of this docket were
18 listed on our intervention request in this docket, just
19 for the purposes of the record.

20 MS. GRABEL: TASC does not have a recent
21 intervention request in this docket, Your Honor. The
22 intervention request filed in this docket was based on
23 2014, I believe.

24 ACALJ JIBILIAN: Mr. Rich, are you saying that
25 in this docket you are not representing the current

1 members of TASC?

2 MR. RICH: No, Your Honor. I am just suggesting
3 that --

4 ACALJ JIBILIAN: Okay. I overruled the
5 objection, and he may answer the question.

6 MR. RICH: Okay. Thank you.

7 THE WITNESS: Well, the only name that's common
8 to both lists is Sunrun.

9 BY MS. GRABEL:

10 Q. Thank you, Mr. Beach.

11 I would now like to show you AIC Exhibit 10.
12 Give me a moment to pass it out.

13 (Brief pause.)

14 BY MS. GRABEL:

15 Q. Do you have it, Mr. Beach?

16 A. I do.

17 Q. Would you please turn to page 8 of 12. This
18 document is a printout from Sunrun's website entitled
19 Get the FAQs, Then Relax. On page 8 of 12 you see under
20 Sunrun certified partners -- actually, I would like to
21 look just above, starting where it says I heard about
22 Sunrun through another solar company, how does Sunrun
23 work with partners. Do you see that, Mr. Beach, in the
24 middle of the page?

25 A. Yes, I do.

1 Q. The second paragraph below that says:

2 Partnership is one of those terms that's easy to
3 throw around. But at Sunrun, it really means something.
4 Our nationwide network of certified partners are the
5 bedrock of our business because they allow us to provide
6 stellar Sunrun service where you live.

7 Did I read that correctly?

8 A. Yes.

9 Q. This document then goes on for quite a few pages
10 to identify Sunrun certified partners, is that right?

11 A. Apparently so, yes.

12 Q. Will you please turn to page 9 of this document.

13 A. Okay.

14 Q. Do you see that LGCY Power is listed as a
15 certified partner of Sunrun?

16 A. Yes.

17 Q. Further down on the page do you see that Solar
18 Universe is listed as a certified partner of Sunrun?

19 A. Yes.

20 Q. If you would turn to page 10 on this document,
21 AIC Exhibit 10, do you see that Sun Time Energy is
22 listed as a certified partner of Sunrun?

23 A. Yes.

24 Q. I would now like to show you, if you turn to AIC
25 Exhibit 11. Again give me a moment to hand it out to

1 everybody else.

2 (Brief pause.)

3 BY MS. GRABEL:

4 Q. Do you have AIC-11 in front of you, Mr. Beach?

5 A. Yes.

6 Q. AIC-11 is a printout from the Demeter Power
7 Group website. Do you see that reflected on the top
8 left-hand corner on page 11?

9 A. Yes.

10 Q. AIC-11 rather.

11 According to the Demeter Power website, it
12 offers services that are available in the open market
13 commercial PACE markets, is that correct, under current
14 markets?

15 A. Yes. The type is rather small, but that's what
16 it says.

17 Q. Microscopic, my apologies.

18 Can you tell whether or not there has been PACE
19 legislation enacted in Arizona from looking at this map?

20 A. This map appears to indicate that there has not
21 been PACE legislation in Arizona.

22 Q. Thank you.

23 It is therefore unlikely that Demeter Power does
24 business in Arizona, is that correct?

25 A. You know, I, I mean PACE is just one form of

1 solar financing. So I have no idea whether Demeter
2 might offer other kinds of solar financing in other
3 markets in Arizona as well.

4 Q. If I represented to you that Demeter Power's
5 website suggests it does not offer any form of financing
6 other than PACE financing, subject to check, would you
7 agree with that?

8 A. Subject to check.

9 Q. Thank you.

10 I would now like you to look at AIC Exhibit 12.
11 And this one killed a lot of trees so it is going to
12 take me a minute to hand out.

13 (Brief pause.)

14 BY MS. GRABEL:

15 Q. AIC Exhibit 12 is a copy of Sunrun Inc.'s Form
16 10-K for the fiscal year December 31st, 2015. Do you
17 see that?

18 A. Yes.

19 Q. Would you please turn to page 21 of 270 of this
20 document.

21 A. Okay.

22 Q. Look at the heading on the second paragraph up
23 from the bottom. It notes that Sunrun's business is
24 concentrated in certain markets putting us at risk of
25 region specific disruptions. Do you see that?

1 A. Yes.

2 Q. Will you please read the first sentence that
3 follows, beginning as of December 31st, 2014 -- 2015.

4 MR. RICH: I am sorry. May I inquire through
5 Ms. Grabel. Where are you?

6 MS. GRABEL: Sure. If you look at page 21 of
7 270, it is the page number noted on the top right-hand
8 of the document.

9 MR. RICH: I got it now. Thank you.

10 MS. GRABEL: Okay. Sure.

11 BY MS. GRABEL:

12 Q. And I am starting with the as of December 31st,
13 2015. My apologies.

14 A. As of December 31st, 2015, the majority of our
15 customers were in California.

16 Q. Would you agree that Sunrun's primary market is
17 in California, not Arizona?

18 A. Well, that's what this says. And it wouldn't
19 surprise me given that California has, by a significant
20 margin, the largest number of solar customers of any
21 state in the country.

22 Q. Thank you.

23 I would now like you to take a look at AIC
24 Exhibit 13.

25 (Brief pause.)

1 BY MS. GRABEL:

2 Q. Do you have it in front of you?

3 A. Yes.

4 Q. AIC Exhibit 13 is a fact sheet published on
5 April 7th, 2016 by the Solar Energy Industries
6 Association. Do you see that?

7 A. I think it says April 7th. I am not sure that's
8 the date you just said.

9 Q. April 7th, correct.

10 A. Okay.

11 Q. Would you please look at the first bullet under
12 at a glance.

13 A. Yes.

14 Q. If you want to take a minute to read that
15 paragraph...

16 A. Okay.

17 Q. Would you agree that, according to SEIA, Arizona
18 has 197 solar contractor installer companies?

19 A. That's what it says, yes.

20 Q. Thank you.

21 Would you agree that TASC membership does not
22 comprise the majority of rooftop solar companies that do
23 business in Arizona?

24 A. Certainly by number I would agree with that,
25 yes.

1 Q. Thank you.

2 I would now like you to turn to AIC Exhibit 14.

3 (Brief pause.)

4 BY MS. GRABEL:

5 Q. Do you have AIC-14 in front of you?

6 A. Yes.

7 Q. AIC Exhibit 14 is a list of the subsidiaries of
8 SolarCity Corporation as of February 10th, 2016. It is
9 filed as an exhibit to SolarCity's annual SEC disclosure
10 filing. Will you please turn to page 7 of this
11 document.

12 A. Okay.

13 Q. Read the first T. It goes alphabetically. The
14 Alliance for Solar Choice, LLC is actually a subsidiary
15 of SolarCity, is that correct?

16 A. That's what this says.

17 Q. Do you believe that SolarCity would make a false
18 representation on its corporate disclosure filing?

19 A. No, I have no reason to think that this is
20 inaccurate.

21 Q. Do you know whether, as TASC's parent company,
22 SolarCity is required to approve TASC's activities?

23 A. You know, in my experience of consulting for
24 TASC, SolarCity has certainly been actively involved in
25 TASC's activities.

1 Q. Is SolarCity paying you for your testimony
2 today?

3 A. In this case I believe they are, yes.

4 MR. RICH: Your Honor, if I can just briefly
5 clarify, and I did this with Ms. Grabel in the last
6 proceeding, this proceeding began before SolarCity
7 withdrew from TASC. And for the purposes of this
8 proceeding, they are a member of TASC. I just clarify
9 that, as I have done previously for Ms. Grabel.

10 MS. GRABEL: And, Mr. Rich, the list of
11 subsidiaries of SolarCity Corporation was filed as of
12 February 10th, 2016, which would be after TASC may have
13 withdrawn -- I mean SolarCity may have withdrawn from
14 its membership. But it is still listed as a subsidiary
15 in its corporate disclosure, correct?

16 MR. RICH: I am not going to be cross-examined
17 here. But I wanted to confirm for the record that it is
18 our -- that SolarCity is a member of TASC for the
19 purposes of this docket.

20 ACALJ JIBILIAN: We can save the rest of any
21 discussion on this for the briefings.

22 BY MS. GRABEL:

23 Q. Did you speak with representatives from
24 SolarCity about your testimony today?

25 A. Yes.

1 Q. Who did you speak with?

2 A. My recollections are that the SolarCity people
3 who have been involved in this, Thad Kurowski and Eliah
4 Gilfenbaum I think reviewed my testimony. They both
5 work for SolarCity.

6 Q. Did you speak with anyone else at SolarCity?

7 A. I think that's probably it.

8 Q. Have you spoken with any of their executives?

9 And by "their," I mean SolarCity's executives.

10 A. I am not sure what, how to define executive.

11 Q. Have you spoken with their president?

12 A. No, not about this matter.

13 Q. Have you spoken with him about other matters?

14 A. Yes.

15 Q. Have you spoken with him about other matters
16 regarding proceedings in Arizona?

17 A. No.

18 Q. Did you speak with any employee of Sunrun for
19 your participation in this docket?

20 A. Yes.

21 Q. Who from Sunrun did you speak with?

22 A. Kim Sanders.

23 Q. Who is Kim Sanders?

24 A. She is an employee of Sunrun who does regulatory
25 work for Sunrun.

1 Q. I would like to turn now to your direct
2 testimony, Mr. Beach. If you would turn to page 3 of
3 your direct testimony, you testify that there is a,
4 quote, developing consensus for using cost effectiveness
5 tests developed for EE and DR programs to analyze the
6 cost effectiveness of solar PV systems, is that right?

7 A. Yes.

8 Q. Specifically you state on line 27 that, quote,
9 this suite of cost effectiveness tests is now being
10 adapted to analyses of NEM and demand-side DG more
11 broadly as state commissions recognize that evaluating
12 the costs and benefits of all demand-side resources --
13 EE, DR, and DG -- using the same cost effectiveness
14 framework will help ensure that all of these resource
15 options are evaluated in a fair and consistent manner.

16 Did I read that correctly?

17 A. Yes.

18 Q. You would agree that the EE and DR tests to
19 which are referred in this sentence are screening tools,
20 correct?

21 A. Yeah, I wouldn't disagree with that
22 characterization.

23 Q. They are not used to establish the amount that
24 ratepayers would pay for the EE and DR programs,
25 correct?

1 A. That's correct. And I think in my introduction
2 I -- that's consistent with my discussion that this
3 methodology is not about setting rates.

4 Q. Well, that actually confused me a little bit,
5 your introduction, because you say the methodology is
6 not about setting rates, but then you go on to say that
7 rates should be adapted to reflect the results of the
8 value of solar analysis.

9 So how exactly would you use the output of the
10 value of solar formula?

11 A. Well, you know, for example, let's say that you
12 do your evaluation and it looks like, you know, let's
13 just say that it looks like nonparticipating ratepayers
14 are getting a benefit, but participating ratepayers,
15 that solar is tough to make it cost effective in a
16 particular market. Well, in that case, the solution
17 might be for the state to implement an incentive program
18 to provide an incentive that's paid for out of utility
19 rates to customers who adopt solar. And so in that
20 case, that would restore the balance between
21 participating and nonparticipating ratepayers. That's
22 one example.

23 Another example would be if you felt like there
24 was a burden on nonparticipating ratepayers from solar
25 DG, so that maybe the RIM test came out, you know,

1 significantly less than one, and you wanted to restore
2 that balance and maybe participating ratepayers were
3 getting, their bill savings were substantially greater
4 than their costs, well, in that case, perhaps you would
5 want to implement a minimum bill or require solar
6 customers to be on time-of-use rates so that it could
7 reduce the lost revenues to the utility and reduce the
8 bill savings to the solar customer and thereby restore
9 the balance. It could work both ways.

10 Q. Assume that the Commission were to find both
11 that DG does benefit nonparticipating ratepayers but
12 also that there is a cost shift between DG customers and
13 non-DG customers because of the allocation of fixed
14 costs in the rate design. Is there a way to incentivize
15 the solar market and still fix the cost shift issue?

16 A. You just said that DG benefits nonparticipating
17 ratepayers.

18 Q. Correct.

19 A. Then there wouldn't be a cost shift.

20 Q. Why?

21 A. Well, the cost shift would be the opposite
22 direction. The cost shift would be from participating
23 ratepayers to nonparticipating ratepayers because the
24 nonparticipants are benefiting. You have it backwards.

25 Q. Well, I suppose that depends on your definition

1 of costs and benefits. One is monetary. The other
2 could be something a little bit more subjective,
3 correct?

4 A. You know, it -- certainly there are some
5 benefits that are more, you know, I don't want to call
6 them subjective, but that are not direct benefits, you
7 know, that are more externalities or societal benefits.
8 And, yes, those can be considered by the regulator in
9 setting that balance.

10 Q. And do you recommend that the Commission
11 consider externalities and other indirect benefits as
12 part of your value of solar analysis?

13 A. Yes. I think you should try to quantify those
14 externalities to the extent you can. And they shouldn't
15 be used directly to change rates or provide incentives,
16 but they certainly should be considered by the regulator
17 in their deliberations.

18 Q. As evidence of the developing consensus, as you
19 stated in your testimony, that you should use the cost
20 effectiveness programs associated with EE and DR, you
21 cite to the California PUC, the Mississippi PUC, and the
22 Nevada PUC, correct?

23 A. Those are examples of commissions that have used
24 this approach, yes.

25 Q. Do you have any other examples that evidence the

1 developing consensus?

2 A. Certainly South Carolina has looked at this kind
3 of balance.

4 Q. Has South Carolina done anything with respect to
5 its DR, I am sorry, DG programs as a result of the cost
6 effectiveness test associated with DR and EE?

7 A. Well, you know, South Carolina, it ended up
8 being the commission conducted a proceeding and the
9 parties settled that proceeding, the result of which was
10 to establish a net metering and a DG program in South
11 Carolina.

12 So they never really got to the stage of
13 actually, you know, conducting the study because
14 everybody reached a meeting of the minds.

15 Q. And isn't it true in California as well that,
16 while they might have done a cost effectiveness analysis
17 using EE and DR tests for DG, they never actually took
18 any action based on that cost effectiveness analysis?

19 A. Well, they definitely took action to extend net
20 metering in California. The order is a little vague on
21 exactly what influence the analysis had. They didn't
22 adopt a particular set of results from the public tool
23 analyses that parties submitted because they feel that
24 those analyses need further refinement. So I would say
25 in California it is, it is not exactly clear from the

1 commission's order the extent to which they considered
2 those analyses.

3 Q. On page 8 of your direct testimony, Mr. Beach,
4 line 21, you actually say the CPUC order does not rely
5 on the public tool analyses, do you not?

6 A. Yes, yes.

7 Q. Isn't it also the case that Nevada has recently
8 found net metering presented a significant cost shift to
9 customers that did not participate in solar DG?

10 A. Yes. And I discuss that in my testimony. And
11 that was largely based on a cost of service study. In
12 my opinion, they also should have considered the net
13 metering study that they conducted in 2014 that
14 basically found a reasonable balance between benefit and
15 costs of net metering in Nevada.

16 Q. I would like to direct you to the same lines you
17 discussed with Mr. Enoch on page 7 of your testimony,
18 starting on line, let's see, 31. Are you there?

19 A. Yes.

20 Q. You state with respect to the Nevada decision
21 that, quote, the elimination of NEM and, in particular,
22 the reduction of the export rate, in the export rate
23 rather, has decimated the rooftop solar market in
24 Nevada, resulting in more than 1,000 documented layoffs
25 at solar companies. Did I read that correctly?

1 A. Yes.

2 Q. Is it your understanding that the rooftop solar
3 market continued to try to market their product and
4 couldn't or that they withdrew from the market because
5 of the change?

6 A. Well, some companies have withdrawn from the
7 market in Nevada. You know, as in Arizona, there are
8 lots of solar companies in Nevada. I assume that some
9 of them are maybe continuing to try to market their
10 systems, but my understanding is it is very difficult
11 now after the --

12 Q. Well, let's look at the --

13 A. -- CPUC decision.

14 Q. -- Sunrun, the member company of the
15 organization that you are testifying on behalf of today.
16 If you would, go back to AIC-12, Sunrun's 10K filing,
17 and look at page 14 of 270. Are you there?

18 A. Yes.

19 Q. Will you please read the last sentence of the
20 second paragraph under the heading electric utility
21 statutes and regulations, electric utility statutes and
22 regulations and changes to statutes or regulations may
23 present technical, regulatory, and economic barriers to
24 the purchase and use of our solar service offerings that
25 may significantly reduce demand for such offerings.

1 What is the very last sentence of that section?

2 A. For example, we recently ceased operations in
3 Nevada as a result of the elimination of net metering.

4 Q. Sunrun's 10-K disclosure indicates that its
5 market exit was intentional. Would you agree?

6 A. In other words, that they made an affirmative
7 decision?

8 Q. To exit the market, correct.

9 A. Yes.

10 Q. I would like you now to take a look at AIC-15.
11 (Brief pause.)

12 BY MS. GRABEL:

13 Q. Do you have it in front of you, Mr. Beach?

14 A. I do.

15 Q. Would you turn to page 15 of this document,
16 which, for the record, is a presentation given by Sunrun
17 for its 2015 Q4 review, dated March 10th, 2016. Do you
18 see that?

19 A. Page 15, is that --

20 Q. Correct.

21 A. Yes, I am there.

22 Q. This is giving guidance and talking about its
23 2016 deployments. Do you see that?

24 A. Yes.

25 Q. Look at the first bullet under MW, megawatts.

1 Here Sunrun notes that it projects deploying 56
2 megawatts in Q1, excluding about 12 megawatts of Nevada
3 backlog not built due to market exit. Do you see that?

4 A. Yes.

5 Q. Would you agree that Sunrun not only ceased
6 operations in the Nevada market but it abandoned
7 12 megawatts of executed net metering contracts when it
8 exited the market?

9 A. You know, I have no idea whether those were,
10 those had signed -- you know, exactly what stage of
11 development that 12 megawatts was in. And my guess is
12 that it, if they had a contract with the customer, that
13 a lot of that would have a mutual agreement between the
14 customer and Sunrun to not go forward with the projects
15 because they really were not meeting the customer's
16 economic expectations any longer.

17 Q. Due to market exit. We have just established
18 that the market exit was intentionally, correct?

19 A. No, due to the change in net metering
20 regulations and rates in Nevada.

21 Q. Except that's not what this document says, does
22 it, Mr. Beach? It says it excludes 12 megawatts of
23 Nevada backlog not built due to market exit. Do you see
24 that?

25 A. Yes. But Sunrun exited the energy efficiency

1 market because of the Nevada PUC's decision to change
2 net metering and to change the rate structure in Nevada.
3 And, you know, there is plenty of documentation that the
4 customers who had signed up for solar expecting to get a
5 different deal were not happy and were seeking a way out
6 of their contracts once the rates and the regulations
7 changed.

8 Q. On page 15 of your direct testimony, Mr. Beach,
9 you testify that a net metering customer that uses the
10 grid but pays a small, zero, or even negative bill still
11 pays fully for his use of the utility system, correct?

12 A. Yes.

13 Q. And this is because, you say, the customer has
14 received credits for excess generation exported to the
15 grid, correct?

16 A. Yes. In terms of the exports, it is the
17 customer who is providing a service to the utility by
18 providing power to the utility. So the customer is
19 compensated by the utility for those exports.

20 Q. On line 14 of your testimony, you say that,
21 quote, these credits are not the result of the solar
22 customer's use of the utility system, unquote, is that
23 correct?

24 A. Yes.

25 Q. Isn't it true that the solar customer uses the

1 utility system to export power to the grid?

2 A. Well, obviously the power is being exported to
3 the grid, but the utility takes title to the power at
4 the meter. So once the power passes the meter, it is
5 the utility's power. And it is the utility that is
6 using their system to deliver that power to the
7 neighbors.

8 Q. And --

9 A. So it is not, it is not the solar customer
10 that's using the system, no.

11 Q. When the utility takes title to the power, when
12 conveyed by the customer, that's a wholesale
13 transaction, is it not?

14 A. You know, I don't think that it is considered,
15 if you are looking for -- it is not considered, for
16 example, by the FERC to be a wholesale transaction, but
17 the power is the utility's once it goes out to the
18 utility system.

19 Q. The utility is not the end user of the power,
20 correct?

21 A. No. The utility delivers the power to the
22 neighbors and gets compensated at the full retail rate
23 for providing that service to the neighbors.

24 Q. Same page, page 14 of your direct testimony, on
25 line 19 you say, quote --

1 A. I'm sorry. You said same page. We were on
2 page 15. We were on page 15. Are we now on page 14?

3 Q. I am sorry. Yes, we are on page 15. You are
4 correct. I am sorry, page 15, line 19.

5 A. Okay.

6 Q. Are you there?

7 A. Yes.

8 Q. You say that, quote:

9 There is the public policy issue of whether the
10 bill credits for exported power at the retail rate are
11 the right credit for these exports, and this case
12 focuses on the methodology for analyzing that issue, but
13 this does not change the fact that the solar customer
14 has paid fully for his or her actual use of the utility
15 system.

16 Did I read that correctly?

17 A. With the exception of changing this to a that,
18 you read it correctly.

19 Q. Fair enough.

20 Would you agree that the bill credits for
21 exported energy depend upon the net metering customer's
22 rate structure?

23 A. Yes.

24 Q. Do you know that APS has a residential demand
25 rate?

1 A. Yes, they do.

2 Q. Do you know that solar customers are
3 participating on that rate?

4 A. There are a few. It is a relatively small
5 portion of their solar population.

6 Q. Do you know that there are more than a thousand
7 solar customers that are participating on that demand
8 rate?

9 A. I am not sure I have seen the number of
10 customers on that rate.

11 Q. So a solar customer who is on APS's three-part
12 demand rate will receive less of a credit for his
13 exported energy product than a solar customer who is on
14 APS's two-part energy rate, is that correct?

15 A. That's likely.

16 Q. Is there any circumstance in which that wouldn't
17 be true?

18 A. Well, the customer also pays a demand charge.
19 And it is possible, but the customer could reduce their
20 demand and get credit for that. But in general, I would
21 agree with you, that the bill savings for the customer
22 will be less under a demand based rate than under a rate
23 that relies on volumetric rates.

24 Q. But it is possible for a solar customer to
25 reduce their demand in response to a three-part demand

1 rate?

2 A. It is not easy but it is possible, yes.

3 Q. So the difference in compensation results from
4 the amount of fixed utility costs that are included in
5 the energy charge, correct?

6 A. Can you repeat that question.

7 Q. Sure. The difference in compensation that a DG
8 customer receives if one is on a three-part demand rate
9 versus a two-part volumetric rate is based on the amount
10 of fixed costs that are included in the energy charge,
11 is that correct?

12 A. Well, first of all, you know, I am not sure that
13 I necessarily agree that -- you know, fixed costs are a
14 matter of perspective. In the short run the utility's
15 costs are fixed. But in the long run there are very few
16 costs that the utility has that are fixed. So just I
17 will put that out there as a bit of a disagreement with
18 your use of the word fixed costs.

19 Generally I would agree that it is, as I said,
20 it is easier for a solar customer to realize bill
21 savings under an all volumetric rate than it is under a
22 rate with a demand charge structure.

23 Q. Is it your contention that both of these solar
24 customers, one on a three-part rate and one on a
25 two-part volumetric rate, have both fully paid for his

1 or her use of the system even though one has paid more
2 than the other?

3 A. Yeah. My point that they both pay fully for
4 their use of the system has to do with the fact that
5 they pay, whenever the meter rolls forward, when
6 power -- when they take service from the utility, when
7 power flows from the utility grid to the customer, the
8 customer pays fully for that use of the utility grid at
9 the retail rate. When the meter runs backwards and the
10 customer is exporting to the grid, they are providing
11 service to the utility and they are not using the
12 utility's system.

13 Q. So the compensation is based purely because of
14 there is a net metering structure in place and not on
15 the dollar amount that's attached to the net metering
16 structure, is that your testimony?

17 A. Well, under different rate designs, customers
18 will be compensated differently under net metering.
19 Because under net metering your exports are compensated
20 at whatever retail rate you are on. And so if the, if
21 you -- two customers can be on different retail rates
22 and will be compensated differently under net metering
23 because of the different rate structure.

24 Q. And that's okay, that fully compensates them
25 regardless what the actual credit to the customer is?

1 A. Well, you know, it is the customer's choice of,
2 you know, of what rate they are on. The demand based
3 rate in Arizona, my understanding is it is an optional
4 rate. You are not required to be on it. So for
5 whatever reason the solar customers who are on the
6 demand based rate, they apparently looked at the
7 economics of that and decided that that was an
8 acceptable deal for them. Perhaps they are able to
9 reduce their demand charges. But, again, it is an
10 optional rate. If they want to be on the all volumetric
11 rate, I don't know of any reason why they couldn't
12 switch to the all volumetric rate. But apparently they
13 decided that their best deal is on the demand based
14 rate.

15 Q. You suggest that the benefits and cost analysis,
16 that methodology you would use in this proceeding, be
17 conducted over a 30, 20 to 30 long term, is that
18 correct, 20 to 30-year long term?

19 A. Yes.

20 Q. I don't think I said that very well. Over a
21 long 20 to 30-year term, I think I like that better.
22 Correct?

23 A. Yes.

24 Q. Are you aware that the majority of customers who
25 have installed rooftop solar in Arizona have leased the

1 system from a solar company?

2 A. That would not surprise me.

3 Q. Would you agree that a solar customer who signs
4 a 20-year solar lease might determine at some point
5 during the lease term to terminate its contract?

6 A. That's possible. And there are, you know, there
7 are provisions in those contracts for, you know, what
8 happens in that event.

9 Q. Go back to AIC Exhibit 12, the Sunrun 10-K. I
10 would like to turn your attention to page 31 of 270.
11 Let me know when you are there.

12 A. Okay.

13 Q. If you could go to the very last section of this
14 page, 31 of 270, under the topping we are exposed to the
15 credit risk of homeowners and payment delinquencies on
16 our accounts receivable, do you see that?

17 A. Yes.

18 Q. Will you please read the first three sentences
19 of this paragraph.

20 A. Our customer agreements are typically for 20
21 years and require the homeowner to make monthly payments
22 to us. Accordingly, we are subject to the credit risk
23 of homeowners. As of December 31st, 2015, the average
24 FICA score of customers under a lease or power purchase
25 agreement was approximately 760, but this may decline to

1 the extent FICA score requirements under future
2 investment funds are relaxed.

3 Q. Please continue to the next sentence.

4 A. While to date homeowner defaults have been
5 immaterial, we expect that the risk of homeowner
6 defaults may increase as we grow our business.

7 Q. Would you agree that Sunrun believes there is a
8 risk that a customer who signs a 20-year lease may
9 decide to default on its contract?

10 A. Yes.

11 Q. Might a customer who signs a 20-year solar lease
12 at some point sell the home to a buyer who does not want
13 or cannot assume the solar lease?

14 A. That's possible. That might be something that
15 gets resolved in the sale of the home I would think.

16 Q. In that case the solar unit on that home would
17 be removed and would no longer generate electricity, is
18 that correct?

19 A. Possible. I think some solar agreements also
20 would allow the original owner of the system to take it
21 with them if they are moving to a house that could, you
22 know, accommodate that system.

23 Q. In such a case the solar unit would go on a
24 different feeder, is that correct?

25 A. Possibly.

1 MR. RICH: Your Honor, I am not sure how much we
2 are going down this road, but Mr. Beach did not testify
3 about solar lease agreements or what happens when people
4 sell their homes, and certainly is not here as an
5 employee of an entity that does that.

6 MS. GRABEL: Thank you, Mr. --

7 MR. RICH: If we are done with that, that's
8 fine. But I would object to further questions about
9 lease contracts.

10 MS. GRABEL: Mr. Beach did offer testimony about
11 taking a look at the value of solar over a 20 to 30-year
12 term. And I am entering into evidence circumstances in
13 which a DG unit will not be performing over a 20 to
14 30-year term, Your Honor.

15 ACALJ JIBILIAN: I don't think there is a
16 question pending, is there?

17 MR. RICH: I think I was a little slow on that,
18 Your Honor.

19 ACALJ JIBILIAN: Okay.

20 BY MS. GRABEL:

21 Q. Might a customer, Mr. Beach, who signs a 20-year
22 solar lease one day buy an electric vehicle which would
23 change the amount of energy he delivers to the utility?

24 A. Yes, that's possible. If a customer's
25 consumption increases, you know, unless he adds more

1 solar panels, the customer will pay for that increased
2 consumption to the utility. So it is not like you can
3 expand your solar panels for free.

4 Q. You would agree, would you not, that events such
5 as lease terminations and purchasing an electric vehicle
6 would change the levelized value of that customer's
7 system, correct?

8 A. No, I wouldn't agree with that.

9 Q. You would not agree with that?

10 A. No.

11 Q. Thank you.

12 A. A customer --

13 Q. I have no further question. Thank you.

14 On pages 20 and 21 of your direct testimony you
15 list several benefits and relatively few costs that
16 should be considered as part of the value of solar
17 analysis, including a societal benefits category for the
18 societal tests, is that right?

19 A. Yes, I list benefits and costs on those pages.

20 Q. And one of those is a societal benefits category
21 for the societal test that you think the Commission
22 should undertake, is that correct?

23 A. Yes.

24 Q. I would like to ask you about other potential
25 items that could be included on such a list. If you

1 would go back to AIC Exhibit 12, the Sunrun 10-K, please
2 turn to page 23 of 270. I am looking specifically at
3 the, under the heading as the primary entity that
4 contracts with homeowners, we are subject to risks
5 associated with construction, cost overruns, delays,
6 regulatory compliance, and other contingencies, any of
7 which could have a materially adverse effect on business
8 and results of operations.

9 Do you see that?

10 A. Yes.

11 Q. Will you please read the second and third
12 sentence under that heading starting with we may be
13 liable.

14 A. We may be liable either directly or through our
15 solar partners to homeowners for any damage we cause to
16 them, their home, belongings, or property during the
17 installation of our systems. For example, we either
18 directly or through our solar partners frequently
19 penetrate homeowners' roofs during the installation
20 process and may incur liability for the failure to
21 adequately weatherproof such penetrations following the
22 completion of construction.

23 Q. Should damage caused by the frequent penetration
24 of homeowners' roofs be included as part of the cost of
25 solar distributed generation?

1 A. You know, I -- that would seem to be something
2 that a solar company would be liable for in the ordinary
3 cost of business. So it is not something that -- it
4 might affect a solar company if they have got
5 substandard installation processes, but it is not going
6 to affect other, shouldn't affect other ratepayers.

7 Q. Could you please turn to page 25 of 270. Here I
8 am looking at the, under the section product liability,
9 claims against us could result in adverse publicity and
10 potentially significant monetary damages. Do you see
11 that?

12 A. Yes.

13 Q. Will you please read the second sentence under
14 that heading.

15 A. Because solar energy systems and many of our
16 other current and anticipated products are electricity
17 producing devices, it is possible that consumers or
18 their property could be injured or damaged by our
19 products, whether by product malfunctions, defects,
20 improper installation, or other causes.

21 Q. Should potential damage to property or injury to
22 person caused by rooftop DG products be considered a
23 cost of solar in the Commission's value of solar
24 analysis?

25 A. No. Again, I think that's a risk to the solar

1 company itself. If there were shoddy installation that
2 resulted in large claims against a solar company, the
3 likely result of that would be that that company might
4 go out of business. But I don't see that that would
5 have a material impact on other ratepayers.

6 Q. If that company went out of business, would that
7 have a material impact on the jobs that that solar
8 company was able to provide?

9 A. Well, as I think we have established, there are
10 a lot of solar companies. So if, you know, if one
11 particularly poorly performing solar company went out of
12 business, you know, I would assume that the workers who
13 weren't incompetent might be able to get hired
14 elsewhere.

15 Q. Please take a look at AIC Exhibit 16.

16 (Brief pause.)

17 BY MS. GRABEL:

18 Q. Do you have AIC-16 in front of you, Mr. Beach?

19 A. Yes.

20 Q. This is an article that appeared in Home Power
21 Magazine entitled PV Safety and Firefighting. Do you
22 see that?

23 A. Yes.

24 Q. Will you please read the first paragraph
25 highlighted in gold.

1 A. Fire safety is typically the last thing people
2 think of when planning their rooftop solar electric
3 system, but it quickly becomes a hot topic when a blaze
4 ignites. Here's a look into the potential hazards of PV
5 systems when a fire breaks out and how to minimize risks
6 to firefighters.

7 Q. And look at paragraph 3 of this article,
8 starting with the presence of rooftop-mounted PV arrays.

9 A. But the presence of rooftop-mounted PV arrays
10 has made cutting through a roof more challenging. In
11 the past, the fire service had plenty of room to
12 ventilate where it is most effective, directly above the
13 fire. With PV arrays now covering large areas of roofs,
14 firefighters are limited in where they can cut and where
15 they can exit the roof. Since PV modules cannot be cut
16 through, and moving them is time-consuming and
17 potentially dangerous, rooftop PV systems pose some
18 risks, mainly shock and trip hazards.

19 Q. If you would, please, turn to page 2. Starting
20 with the third real paragraph, will you please read the
21 paragraph starting with during daylight.

22 A. During daylight, there can be enough voltage and
23 current to injure or even kill a firefighter who comes
24 in contact with the energized conductors.

25 Q. And would you read the last sentence of that

1 paragraph.

2 A. Here's an example. If a firefighter
3 accidentally or deliberately axed through a string of
4 twelve 44-volt DC modules, he or she will experience a
5 potentially deadly surge of 528 volts.

6 Q. Mr. Beach, should the potential for injury or
7 death to firefighters described in this section be
8 considered in the cost of solar DG analysis?

9 A. You know, if you could quantify the likelihood
10 of that happening and posing -- and then the likelihood
11 that the firefighter wouldn't be trained in how to deal
12 with it, I suppose you could consider it. But it seems
13 like certainly something that should be considered from
14 a safety perspective. But it is very difficult to
15 quantify these kind of low frequency events.

16 Q. Are you suggesting that the assumptions
17 underlying such an analysis might be difficult to be
18 sure of?

19 A. Yes.

20 Q. And therefore you would not include it?

21 A. Well, I don't -- I haven't seen any -- it
22 certainly is something that people should think about,
23 as obviously they have here. But in terms of -- unless
24 you assume that everybody who has a solar house is going
25 to burn down, then it might not be worth considering.

1 Q. Will you please turn to page 3 of this document.

2 Will you please read the first real paragraph on page 3.

3 A. The one that begins in a nighttime fire?

4 Q. Nighttime fire, correct.

5 A. In a nighttime fire where the attic space was
6 exposed to severe heat damage, the conduit and wires
7 inside may have become compromised. Some arcing could
8 begin as the rising sun energizes the modules the
9 following morning, a potential for starting a new fire.
10 A qualified solar contractor should be called in to
11 disconnect the arrays. Unfortunately, most PV companies
12 do not have an on-call technician available, so the
13 disconnect usually must wait until the next day, not
14 always the safest measure. In this case, most fire
15 departments will post a fire watch until a qualified
16 contractor can ensure that the array is disconnected.

17 Q. Thank you, Mr. Beach.

18 Should the cost of additional first responder
19 time required for homes with solar arrays that catch
20 fire be included as part of the value of solar analysis?

21 A. I don't think -- that doesn't strike me as a
22 very significant expense, given the current penetration
23 of solar. I would be surprised if there are any fire
24 departments that have added personnel as a result of
25 people having solar on their house.

1 Q. Do you believe that if an expense is
2 insignificant compared to the rest of value, rest of
3 value of solar, it not be included in the value of solar
4 analysis?

5 A. Probably, yes.

6 Q. Take a look at AIC Exhibit 17.

7 (Brief pause.)

8 BY MS. GRABEL:

9 Q. If you want to take a moment to review this
10 document, Mr. Beach, you are welcome to.

11 Mr. Beach, what is in front of you is a 93-page
12 report prepared by The Fire Protection Research
13 Foundation entitled Fire Fighter Safety and Emergency
14 Response for Solar Power Systems, is that correct?

15 A. Yes.

16 Q. And if you would turn to the third page in this
17 document, under the forward, do you see that?

18 A. Yes.

19 Q. If you would go to the fourth paragraph down,
20 second sentence, special thanks are expressed to U.S.
21 Department of Homeland Security, AFG Fire Prevention &
22 Safety Grants for providing the funding for this project
23 through the National Fire Protection Association. Do
24 you see that?

25 A. Yes.

1 Q. Mr. Beach, should the cost of time and resources
2 invested by our federal government in researching,
3 writing, and publishing this report how to fight fires
4 on homes with solar panels be included in the value of
5 solar analysis?

6 A. You know, I assume that this is a document that
7 would apply nationally. So I would assume that if
8 you -- you know, the federal government does lots of
9 different kinds of research on lots of different topics.
10 I think if you spread the cost of this probably
11 important report over the whole country and the whole
12 industry, for the purposes of what we are doing here I
13 think it would probably not rise to the level of needing
14 to be included.

15 Q. Would you include the time and resources spent
16 by local and state agencies in implementing the
17 recommendations of this report in the value of solar
18 analysis for Arizona?

19 A. You know, if it turns out that those are
20 significant, then that might be something that you would
21 want to include. I am not aware that they are.

22 Q. Have you ever looked at them?

23 A. I have not looked at this particular issue, no.

24 Q. Look at your rebuttal testimony, Mr. Beach, on
25 page 5.

1 A. Okay.

2 Q. You state on line 6 that, quote, a utility whose
3 future financial returns are threatened by renewable DG
4 faces a conflict of interest in presenting a balanced
5 view of the long-term benefits and costs of DG
6 resources.

7 Did I read that correctly?

8 A. Yes.

9 Q. Wouldn't it also be true that a solar company
10 whose future financial returns are threatened by a
11 change to the existing net metering, slash, volumetric
12 rate design regime face a conflict of interest in
13 presenting a balanced view of the long-term benefits and
14 costs of DG resources?

15 A. Well, I think that, you know, that's why these
16 matters are adjudicated by an impartial commission.

17 Q. And for such a solar company, isn't it in the
18 firm's best interest to derive a methodology that
19 results in a value of solar that is higher than the
20 utility's retail rate?

21 A. Probably not, because the, I think the
22 likelihood that a commission is going to increase the
23 compensation to above the retail rate, especially in a
24 market that is doing quite well, is probably very low.
25 And I am not aware of any solar company that has

1 proposed to increase compensation above the retail rate
2 in a market that is -- where, you know, installations
3 are occurring and the industry is growing. So I don't
4 think that would be a likely position for the industry
5 to take.

6 Q. If the value of solar is found to be below the
7 retail rate, is that in the solar industry's best
8 interests?

9 A. Well, you know, the problem is where you get in
10 situations like Nevada where the compensation is reduced
11 by such an extent that it no longer is economic for
12 customers to install solar in that market, and then you
13 basically kill the market. And that's certainly
14 something that the solar industry is trying to avoid.

15 Q. And, again, the solar industry then would like a
16 value of solar that preserves the economic benefits to
17 its DG customers, correct?

18 A. We think there should be a balance between
19 customers who participate in the solar market and
20 customers who do not. We think that that's what will
21 best assure the long-term growth of the market, is if we
22 have both happy solar customers and happy nonsolar
23 customers.

24 Q. You didn't answer my question.

25 A. Yes, I did. I said there should be a balance

1 between the two. That was the answer to your question.

2 Q. Does the solar industry want to preserve the
3 economic benefits of its transaction with DG customers?

4 A. Yes. There has to be economic benefits or
5 customers won't put solar on their roofs.

6 MS. GRABEL: Thank you very much. No further
7 questions.

8 ACALJ JIBILIAN: This is a good time for our
9 morning break. So we will come back here in 15 minutes.

10 (A recess ensued from 10:33 a.m. to 10:51 a.m.)

11 ACALJ JIBILIAN: Let's go back on the record.

12 Mr. Patten, do TEP and UNSE have questions for
13 this witness?

14 MR. PATTEN: I do, Your Honor. Thank you.

15

16 CROSS-EXAMINATION

17 BY MR. PATTEN:

18 Q. Good morning, Mr. Beach.

19 A. Good morning.

20 Q. Could you turn back to page 7 of your direct
21 testimony. And at the bottom of that page you indicate
22 that a thousand documented layoffs at solar companies
23 took place in Nevada. Do you know how many of those
24 workers worked for rooftop leasing companies such as
25 SolarCity or Sunrun?

1 A. As I recall, the majority did, but not all.

2 Q. Okay. Safe to say the majority, though?

3 A. You know, 60 percent or something on that order.

4 Q. Okay. Do you know what the typical payback
5 period was for rooftop DG purchased in Nevada prior to
6 the Nevada decision?

7 A. Yeah. It was -- there is quite a bit of
8 evidence on that in the record. It was somewhere
9 between 15 and 20 years.

10 Q. Before the --

11 A. Yes.

12 Q. Before the Nevada decision, all right. Do you
13 know how solar lease payments are set?

14 A. I know generally. There is quite a bit of
15 variation, you know, in the industry. There is, you
16 know, a number of different approaches. So, and my
17 knowledge is only kind of general about how the lease
18 agreements work.

19 Q. And when you say there is some variation, does
20 that mean some customers get better deals than other
21 customers?

22 A. Well, there is some -- there is certainly a
23 difference from agreement to agreement. And there also
24 are leases. There are PPAs. Some customers buy the
25 system outright. Some customers get their own

1 financing. So there is the whole PACE financing that
2 was alluded to this morning. So there are a variety of
3 different approaches.

4 Q. All right. And you understand in Arizona that
5 they use a solar lease and not a solar PPA, correct?

6 A. Actually, I was not aware of that.

7 Q. All right. Let's talk about solar leases now in
8 terms of the rates that they set in those leases. Do
9 you know what internal rate of return is used to set the
10 solar lease rate?

11 A. No.

12 Q. And do you know what level of administrative or
13 overhead costs are used to set solar lease rates?

14 A. You mean the solar companies?

15 Q. The solar companies.

16 A. No, I don't. I have no idea.

17 Q. And do you know net metering is factored into
18 the solar lease rate?

19 A. What do you mean? How it is factored in?

20 Q. How it influences the solar lease rate.

21 A. No.

22 Q. All right. And do you know how they value the
23 renewable energy credits that the solar leasing
24 companies retain in calculating the solar lease rates?

25 A. No, I don't know what value they ascribe to

1 those.

2 Q. All right. Solar panels are currently warranted
3 for 20 to 25 years. Is that your understanding?

4 A. Yes.

5 Q. And do you believe there is an appropriate
6 payback period for someone who buys a rooftop system?

7 A. Well, it certainly needs to be less than, you
8 know, the warrantied life of the system.

9 Q. All right. But you don't really have an opinion
10 whether it should be 10 years, 15 years, five years?

11 A. You know, obviously the shorter the payback the
12 more attractive it is to the customer. That's, I think
13 that's pretty obvious. And it does need to be less than
14 the life of the system to make it economically appealing
15 to the customer.

16 MR. PATTEN: All right. That's all I have, Your
17 Honor.

18 ACALJ JIBILIAN: Thank you.

19 Mr. Loquvam.

20 MR. LOQUVAM: Thank you, Your Honor.

21

22 CROSS-EXAMINATION

23 BY MR. LOQUVAM:

24 Q. Good morning, Mr. Beach. How are you?

25 A. I am all right. How are you?

1 Q. I am doing really well. Thank you.

2 When customers with rooftop solar have reduced
3 bills, they contribute less to utilities' fixed costs,
4 correct?

5 A. Well, in the -- again, we had this discussion
6 about fixed costs. And if you define fixed costs as
7 being fixed in the short run, yes, they contribute less
8 to those costs.

9 Q. And I am talking about test year fixed costs.

10 A. Yes.

11 Q. And in the next test year with the next rate
12 case, responsibility for those fixed costs shifts to all
13 other customers who don't have rooftop solar, correct?

14 A. Well, some of those costs may be shifted. But
15 the key thing is that, over time, the utility will need
16 to put in less infrastructure on its system as a result
17 of the presence of distributed generation. That's
18 something that is, you know, difficult to see except
19 when you get cases like the Pacific Gas & Electric
20 recently announcing that it was deferring all those
21 transmission projects in part because of energy
22 efficiency and rooftop solar.

23 But over time, over multiple rate cases, the
24 presence of DG will allow the utility to build fewer
25 generating plants and install less T&D infrastructure.

1 So over time there will be long-term benefits to
2 customers. And there will not be, you know, there will
3 not be a cost shift.

4 Q. No, and I understand the hypothetical benefits
5 that TASC has paid you to discuss. But my question is:
6 Purely from a rate perspective, coming out of the second
7 rate case, rates will be going up for customers without
8 rooftop solar because, in the immediate short term based
9 on that new test year, fixed costs responsibility is
10 shifted to them, correct?

11 A. Assuming that you -- that could happen assuming
12 that, you know, you don't have a situation, for example,
13 where, you know, the energy only, the fuel savings
14 benefits are so big that there is savings for everybody.

15 Q. So setting aside the possibility of some fuel
16 savings, all the other fixed costs are transferred,
17 correct?

18 A. Well, again, I am not going to agree that it is
19 all. Because there are, there can be immediately some
20 capacity savings as well that may show up as soon as the
21 next rate case.

22 Q. Have you done any studies on the time frame of
23 capacity savings in APS's service territory?

24 A. Yeah. I think that if you look at our
25 cost/benefit study, you know, we are assuming that there

1 are those kind of benefits kind of continuously.

2 If you look at APS's, for example, your T&D
3 infrastructure, it does vary based on your peak demand.
4 And as your peak demand goes up, you add T&D
5 infrastructure, so that if solar that's added this year
6 reduces your peak demand, that's going to reduce your
7 T&D infrastructure on a continuous basis.

8 Q. So if APS were to file a rate case and then in
9 the next year file that second rate case, we would only
10 be looking at the incremental DG penetration since that
11 last rate case, correct, for purposes of this
12 discussion?

13 A. Yeah. Whenever you file a rate case, you look
14 at what your, at what your demand, what your demand is
15 and what you expect it to be in the near future in terms
16 of what you have to serve, so that if customers are
17 conserving and they are enrolling in demand response
18 programs and they are adding DG, all of those factors
19 can combine to reduce your demand to the point that you
20 actually would not -- you would defer projects instead
21 of building them. You would have fuel savings. So
22 there can be both capacity related as well as fuel
23 savings benefit.

24 Q. And I appreciate that. That's in your direct.
25 But, you know, there is a possibility we get done today,

1 and I would really like to. If we don't, we don't. But
2 longer question -- longer answers to otherwise pretty
3 simple questions will guarantee we go into next week.
4 So either way you want to play it.

5 I guess my question to you is this: Setting
6 aside the possibility of a sliver of capacity savings on
7 one-year DG penetration and the possibility there might
8 be some fixed costs embedded in fuel costs, the cost
9 responsibility for fixed costs shifts to non-DG
10 customers in that next year rate case, correct?

11 A. Well, you know, rate cases only happen once
12 every, what, three, four or five years. So there is a
13 depreciable period.

14 Q. A rate case is going to happen anytime a utility
15 wants to file them, correct?

16 A. I think it depends on the state. I am not sure
17 what the rate case plan is in Arizona. But typically
18 there are a few years between rate cases.

19 Q. Okay. So one, two, three years, the answer is
20 still correct to my original question, correct?

21 A. I think I have already answered your question.

22 Q. Okay. I am going to pass out what I have
23 labeled as Exhibit APS-14. I think that's the next
24 number.

25 What was your participation in the Nevada

1 proceeding that led to the decision memorialized in
2 Exhibit APS Exhibit 11?

3 A. I was a witness in that proceeding for TASC both
4 in the proceeding that led up to the decision that
5 changed net metering and rates at the end of
6 December 2015, and I was also a witness in the
7 grandfathering phase of that case that happened in early
8 February.

9 Q. Okay. I have placed or I have had placed in
10 front of you what I have labeled as APS-14. And it is
11 an article from Fortune Magazine dated April 12, 2016
12 entitled The Other Side of the Solar Firestorm in
13 Nevada. And if you could turn to page 7 of 9, please.

14 Mr. Beach, do you agree that climate change is
15 happening?

16 A. Yes.

17 Q. And the first full paragraph, it states:

18 We were one of the first states to say --
19 actually, let me go back a moment. And beginning on
20 page 4 it begins a Q and A interview with Chairman
21 Thomsen from the Nevada PUC. And page 7 is a
22 continuation of that. So these are Chairman Thompson's
23 words, and it begins on page 7:

24 We were one of the first states to say there is
25 empirical evidence that there is this cost shift. The

1 solar industry didn't want to hear that. They can try
2 to discredit all the studies they want, but we have an
3 open public case and all of the financial analysts and
4 economists in this building that set rates said we found
5 this cost shift and here is our proposal to mitigate it.
6 A lot of the discussion leading up to this was about,
7 "Is there a cost shift?" And I put that in the category
8 of climate deniers. Let's move on from that.

9 Did I read that correctly?

10 A. Yes.

11 Q. Would you disagree with Chairman Thomsen's
12 characterization of those who deny the cost shift?

13 A. Yeah. I don't -- I mean, again, I think I made
14 clear earlier the Nevada commission relied on a cost of
15 service study, and I don't agree that that's the right
16 way to evaluate whether it is a cost shift or not.

17 Q. So if viewed from the perspective solely of the
18 cost of service study, and I will set aside the value,
19 and I understand you have a different opinion of that,
20 but viewed from the perspective solely of a cost of
21 service study, do you believe there is a cost shift?

22 A. In Nevada?

23 Q. No, as a general function under volumetric
24 two-part rates.

25 A. You are asking me to evaluate net metering under

1 two-part rates using only a cost of service study?

2 Q. Yes.

3 A. I, you know, I would have to look at the cost of
4 service study. I can't make a generalization that, you
5 know, it would show a cost shift in every circumstance.

6 Q. Have you ever seen a circumstance in which it
7 did not?

8 A. Well, there, there have only been a few
9 statements that have tried to analyze this issue using a
10 cost of service study. Nevada and Arizona are the only
11 two that I am aware of. And so it is a pretty small
12 sample.

13 Q. But neither of them -- or both of them showed a
14 cost shift, correct?

15 A. Well, the utilities' studies, yes, showed a cost
16 shift.

17 Q. In fact, the Nevada commission adopted that
18 finding --

19 A. They adopted NV Energy's study.

20 Q. And -- okay. Do you have in front of you your
21 direct testimony?

22 A. Yes.

23 Q. Can you turn to the study you have attached to
24 it.

25 A. Okay.

1 Q. Which is the value of solar study you performed
2 concerning APS's service territory, correct?

3 A. Yes.

4 Q. And it is based on all the available data you
5 had regarding APS's rates and future forecasts, is that
6 correct?

7 A. Yes.

8 Q. Could you turn to page 23, please. And in
9 paragraph 6 you state: The primary cost of solar DG for
10 nonparticipating ratepayers are the retail rate credits
11 provided to solar customers through net metering, i.e.
12 the revenues that the utility loses as a result of DG
13 customers serving their own load.

14 Did I read that correctly?

15 A. Yes.

16 Q. Is this a cost shift, is this your statement as
17 to what you believe the cost shift is?

18 A. No. This is a benefit/cost study. And the lost
19 revenues are the cost side of the equation. The -- if
20 there is a cost shift, it would be the difference
21 between benefits and costs.

22 Q. Over a period of time?

23 A. These are a 20-year study.

24 Q. Okay. But it is the net of those two given that
25 time frame in your study, correct?

1 A. Yes.

2 Q. If we use a different time frame there would be
3 a different result, is that right?

4 A. Probably, yes.

5 Q. And if, for instance -- actually, strike that.
6 All of the benefits identified in your study
7 occur in the future, correct?

8 A. Well, I did a study that looks ahead 20 years.
9 So by definition, all the benefits are in the future.
10 Some of them are in the first year. Some of them are in
11 the 20th year. And they occur all, you know, during the
12 course of that period.

13 Q. Did you identify which occur in the first year?

14 A. Yeah. I think if you looked at my work papers,
15 you could see, you know, what the benefits were in the
16 first year versus the tenth year versus the 20th year.

17 Q. But those weren't tied to specific projects;
18 they were just simply levelized amounts over those
19 years, right?

20 A. Well, to some extent they were. For example,
21 some of them were based on, you know, fuel savings in a
22 specific year. Like the T&D savings were based on
23 regressions of APS's investments in T&D infrastructure
24 as a function of peak demand, so that to the extent that
25 peak demand is reduced by DG, those regressions show,

1 you know, kind of on average how much your spending on
2 T&D infrastructure will be reduced.

3 Q. On average meaning it is not a particular
4 project in a particular year but, instead, is an average
5 or levelized or some sort of spreading of the
6 hypothetical savings over 20 years, correct?

7 A. Yeah. In that case I did not identify specific
8 projects.

9 Q. Did you for any of the capacity savings you
10 identified or discussed in your report?

11 A. Well, the, you know, the generation capacity is
12 based on combustion turbine as the kind of the marginal
13 unit for APS. So that was based on the cost of a
14 specific resource that APS would add as a source of
15 capacity in the future.

16 Q. In the future, not year one?

17 A. No, not necessarily year one.

18 Q. Some undetermined period in the future
19 hypothetically?

20 A. Well, there are capacity savings in every year
21 of the 20 years. And you value those at the cost of
22 capacity, which is the cost of a combustion turbine.

23 Q. Is this the lumpiness discussion where there is
24 a lumpy acquisition of capacity by the utility and so
25 you and Ms. Kobor from Vote Solar suggest that we value

1 capacity on a continuous basis?

2 A. Yes.

3 Q. So it was, it requires an affirmative decision
4 by the Commission to look at future lumpy capacity
5 savings on a continuous basis in order to have the
6 year-to-year capacity savings that you are discussing?

7 A. Well, I don't think it is -- this is not a -- it
8 is a method that's used to value all sorts of capacity
9 additions that, especially for demand-side resources,
10 that happen in small increments.

11 You know, you get capacity savings from putting
12 in more efficient air conditioners. You know, doing
13 one -- doing one efficient air conditioner is not going
14 to defer a combustion turbine, but it can defer a small
15 piece of a combustion turbine. And when summed over all
16 the demand-side programs and all the DG resources, there
17 will be enough there to defer, you know, those
18 resources.

19 Q. Can you turn to page 13 of your direct, please.

20 A. Okay.

21 Q. Go to lines 26 to 28. It says: There are
22 always cost shifts when a customer reduces the demand
23 placed on the grid or shifts load to a different time
24 period as the result of many types of actions that
25 utilities and regulators encourage, energy efficiency,

1 demand response, or using DG to serve your own load.

2 Did I read that correctly?

3 A. Yes.

4 Q. So here aren't you saying that that DG used to
5 serve a customer's load shifts costs?

6 A. Well, that's what, you know, that's what we are
7 trying to assess in this methodology, is what are the
8 cost shifts. Yeah, there are always cost shifts.
9 Energy efficiency programs shift costs.

10 Q. Okay. But we are discussing DG used to serve a
11 customer's load. That shifts costs as well, correct, or
12 do you want to change this testimony?

13 A. It can, yes.

14 Q. It can. It can or it does? Because you said
15 there are always costs --

16 A. I think we established that the cost shift is
17 the difference between the benefits and the costs. You
18 know, the cost shifts can -- you know, you are very
19 rarely going to find that the benefits and the costs
20 exactly equal each other. So there will be a cost shift
21 in one direction or another.

22 Q. If there is a cost shift that is not mitigated
23 by a benefit, now or in the future, is that fair to
24 customers who are now bearing that cost shift?

25 A. Well, that's a policy decision for the, you

1 know, the Commission to make.

2 Q. What do you think?

3 A. You know, I think that there certainly can be
4 resources for which there is a cost shift. And the
5 Commission can find that there are, for example,
6 societal benefits from those resources that are such
7 that you are willing to live with that cost shift.

8 I know, for example, energy efficiency programs,
9 a lot of them don't pass the RIM test and so they raise
10 rates for nonparticipating customers, but because they
11 pass the total resource cost test, the commissions will
12 adopt them.

13 Q. So is it your testimony that it is not an issue
14 of fairness or equity?

15 A. It is an issue that should be looked at by the
16 Commission. But the fact that, you know, a resource
17 doesn't pass the RIM test and raises rates for
18 nonparticipating ratepayers should not necessarily mean
19 that it is a resource that shouldn't be pursued.

20 Q. Okay. My question was about whether this is an
21 issue of fairness or equity from your perspective.

22 A. It is an issue of fairness, yeah.

23 Q. So it is unfair potentially if customers who are
24 non-DG customers experience a cost shift that exceeds
25 the hypothetical benefits of rooftop solar?

1 A. Well, I think that's, you know, that's something
2 that the Commission has to weigh. And the purpose of
3 this methodology is to put all the information in front
4 of it about what the long-term benefits --

5 Q. I understand the Commission needs to weigh it
6 ultimately, but I am asking you -- you are the expert
7 opinion, you have testified about this in numerous
8 states -- is it an issue of fairness or equity?

9 A. In terms of finding that balance between
10 participating and nonparticipating customers, yes, it is
11 a matter of fairness and balance.

12 Q. And would it be unfair or inequitable for costs
13 exceeding benefits to be shifted to customers without
14 DG?

15 A. It could be.

16 Q. In what circumstance? Because we are talking
17 about cost exceeding benefits, and I understand that's a
18 hypothetical because you disagree with that concept. I
19 am not trying to trap you there. I am just saying if,
20 in fact, the costs exceed the benefits and those costs
21 are then shifted to non-DG customers, is that an issue
22 of equity or fairness.

23 A. It could be. And it could be a reason to make,
24 as I have testified, it could be a reason to make
25 changes in rate design to remedy that balance.

1 Q. In front of you is something marked as APS
2 Exhibit 15 entitled, it is Chapter 9, Subsidizing Solar
3 Technology Deployment. And it is part of an MIT study
4 entitled The Future of Solar Energy. And this is the
5 complete Chapter 9. And each chapter, I will represent,
6 is distinct.

7 If you could, turn to page 225. Have you seen
8 this document before?

9 A. I have read parts of this study. I haven't read
10 the whole thing.

11 Q. Are you there?

12 A. Page 225?

13 Q. Yeah.

14 A. Yes.

15 Q. So the nonbolded paragraph on the right states:
16 Finally, as we have discussed at several points,
17 because residential PV generation is much more expensive
18 than utility scale PV generation, the subsidy cost per
19 kWh of residential PV generation is substantially higher
20 than the per kWh of subsidy cost of utility scale PV
21 generation. There is no compensating difference in
22 benefits and thus there is simply no good reason to
23 continue to provide more generous subsidies for
24 residential scale PV generation than for utility scale
25 PV generation.

1 And it continues on the next page:

2 Net metering with per kW charges to cover
3 distribution costs is an important reason why
4 residential PV generation is more heavily subsidized
5 than utility scale PV generation. In addition, net
6 metering raises equity issues: it is far from obvious
7 that it is fair for consumers with rooftop PV generators
8 to shift the burden of covering fixed distribution costs
9 to renters and others without such systems.

10 Did I read that correctly?

11 A. Yes.

12 Q. Do you agree with MIT's statement here?

13 A. No, I don't.

14 Q. So they are saying it is far from obvious it is
15 fair, and you just said there could be a fairness issue.
16 How or why do you disagree?

17 A. Well, I, you know, I don't agree that the
18 subsidy costs per kilowatt hour of the residential PV
19 generation is substantially higher than the per kilowatt
20 hour subsidy cost of utility scale. You know, I have
21 looked at that issue in, you know, in Colorado for
22 example and basically found that the benefits, the net
23 benefits were roughly the same for rooftop and utility
24 scale. So I, you know, I disagree with their conclusion
25 here as a matter of, you know, the way they did their

1 analysis.

2 Q. So you are saying it is an equity issue or
3 isn't?

4 A. I am not clear what you mean by whether it is an
5 equity issue or not.

6 Q. Okay. Well, let's figure that out. Could you
7 turn to page 5 of your direct testimony. At lines 5 to
8 you state:

9 If the utility's lost revenues and program costs
10 are greater than its avoided cost benefits, then rates
11 may rise for nonparticipating ratepayers in order to
12 recover those costs. This can present an issue of
13 equity among ratepayers.

14 Did that I read that correctly?

15 A. Yeah, and I think that's what we have just been
16 discussing.

17 Q. Okay. So you agree with this statement but not
18 MIT's version of this statement?

19 A. Well, I don't, I don't -- you know, I haven't
20 gone through the MIT's numbers that led them to that
21 conclusion. So I don't necessarily agree with the MIT
22 study.

23 Q. So you disagree with the portion of MIT's
24 concern that concerns the subsidy per kWh analysis?

25 A. I disagree with their comparison between rooftop

1 and utility scale, that there are, there is inherently
2 more of a subsidy involved in rooftop than in utility
3 scale.

4 Q. If the savings don't materialize that you
5 forecast in your study, then the cost shift remains
6 unmitigated, correct?

7 A. In other words, if there were some reason there
8 were no benefits at all from solar, then there would be
9 only costs, is that the hypothetical?

10 Q. I am saying if the savings identified in your
11 particular study regarding fixed costs, capacity
12 savings, if those don't materialize, then the cost shift
13 will remain unmitigated, correct?

14 A. Well, I think there is always some uncertainty
15 when you are doing forecasts and projections. There are
16 certainly ways to, you know, try to bound uncertainty.
17 You can use sensitivity analysis. You can look at
18 forward market prices if you are concerned about the
19 robustness of some of the forecasts.

20 But I think it is, it is, the idea that there
21 just wouldn't be any benefits at all is kind of
22 ridiculous.

23 Q. And I understand that position. And I am not
24 saying that, asking you to adopt that. But I will say
25 it this way. To the extent that the savings do not

1 materialize, the cost shift is thus concomitantly
2 reduced or unmitigated, correct?

3 A. Well, for example, you know, your hypothetical
4 is assuming that the cost side is remaining constant.
5 And let's say that the benefits don't turn out to be as
6 high as I projected them to be because natural gas
7 prices were lower. Well, natural gas prices also have a
8 big effect on utility rates. So if natural gas prices
9 are lower, it means utility rates are not going to be as
10 high as I forecasted. And that's going to affect the
11 cost side. So something like that will affect, you
12 know, both sides of the equation.

13 Q. And I'm not really talking about the energy
14 savings, which is the basis for the equivocation you
15 just had. I am referring to the fixed capacity costs.

16 If, for instance, the transmission lines and the
17 specific routes and the specific types of plants that
18 APS has forecasted in its IRP aren't needed for whatever
19 reason, customers don't move into the particular area of
20 the valley that form the basis of those forecasts or
21 load growth does not occur, or everyone decides to move
22 to SRP's service territory, in those circumstances, or
23 to the extent that those circumstances occur and reduce
24 these forecasted capacity benefits, the cost shift is
25 similarly unmitigated?

1 A. You know, I agree with that. I also, but I
2 would add that it could happen the other way, too.
3 Everybody could face their panels west. And you could
4 have cheap storage technologies that increase the
5 capacity value of solar. People could install this
6 stuff due to a well planned utility program in the parts
7 of its service territory where it is most needed and it
8 has a higher value than average. Those could also
9 happen and result in higher benefits than I have
10 projected.

11 Q. Are you aware of any commission in the country
12 that has used long-term forecasts to set rates?

13 A. We are not setting rates here. I think I made
14 that clear in my introduction.

15 Q. I understand that. My question is about setting
16 rates. Are you aware of any commission in the
17 country --

18 A. Some commissions --

19 Q. Sir, sir, if I could finish, because talking
20 over each other isn't great for the court reporter.

21 Are you aware of any commission in the country
22 that has used long-term forecasts to set rates?

23 A. Well, California and Nevada used long-run
24 marginal costs to set rates. So to some extent those
25 are based on long-term forecasts.

1 Q. And do you know what the time frame of those
2 long-run marginal costs are?

3 A. California tends to look out on the order of
4 five years.

5 Q. Do they true them up?

6 A. What do you mean by true them up?

7 Q. Meaning once they start getting to the years
8 they previously forecasted, they look at actuals and
9 make sure customers are held harmless.

10 A. No, they don't do that. They, they certainly
11 true up things like fuel costs. And California has full
12 revenue decoupling. So they take out the effective
13 sales fluctuations.

14 Q. Okay. And are you aware of any commission or
15 other body that has used a value of solar model to set
16 rates?

17 A. To set rates?

18 Q. Yes.

19 A. Not to set rates.

20 Q. Are you aware of any commission or body that has
21 used a value of solar tariff to approve and continue net
22 metering?

23 A. Well, again, I -- you know, California made a
24 significant effort to do exactly this kind of analysis
25 for -- through its public tool and took a lot of

1 evidence on the benefits and costs in California. They
2 did not in the end, I think as we have discussed, they
3 did not rely on that evidence. But it is certainly my
4 anticipation that they are going to continue to look at
5 those kind of numbers in the future.

6 Q. But as you are sitting here today, you are not
7 aware of any body or commission that has used a value of
8 solar analysis to vet net metering and decide to keep it
9 going?

10 A. Well, yeah. Colorado did. Colorado looked
11 at -- we did a benefit/cost study in Colorado and
12 participated in some extensive workshops with Xcel
13 Energy over an 18-month period. And the outcome of
14 those workshops was that the Colorado commission decided
15 to maintain net metering in Colorado.

16 Q. Was that an evidentiary process?

17 A. It was not an evidentiary process. It was a
18 workshop process.

19 Q. What --

20 A. It was in front of the Commissioners, though.

21 Q. What is a prosumer?

22 A. A prosumer is a customer who both produces and
23 consumes energy.

24 Q. And a rooftop solar customer is a prosumer?

25 A. Yes, they are an example of a prosumer.

1 Q. And page 11 of your direct, you discuss the
2 three states of a rooftop solar prosumer customer?

3 A. Yes.

4 Q. And those three states are the retail customer
5 state, the energy efficiency state, and the power export
6 or net metering state, is that right?

7 A. Yes.

8 Q. Are you aware of any other customer class in
9 APS's service territory also whose service or load
10 characteristics involve or incorporate these three
11 states?

12 A. Probably not.

13 Q. So when customers export power to the utility
14 from a rooftop solar array, you testified earlier that
15 title transfers to the utility, correct?

16 A. Yes.

17 Q. And that's the same as when a wholesale supplier
18 of grid scale power exports power from their facility to
19 the grid as well, correct?

20 A. Yes.

21 Q. In both instances title passes to the utility?

22 A. That's my understanding.

23 Q. And then the utility resells that power to other
24 customers, correct?

25 A. Yes.

1 Q. And so in both circumstances, aren't both acting
2 in a wholesale capacity?

3 A. Well, in the respect that the power has been
4 transferred to the utility, whether that is exactly how
5 wholesale transactions are defined by FERC, I would have
6 to ask a lawyer.

7 Q. How long have you been in this industry?

8 A. 35 years.

9 Q. And have you ever seen a wholesale trans -- have
10 you seen a lot of wholesale transactions? Have you had
11 experience with them?

12 A. Yes.

13 Q. And do you feel yourself qualified to opine on
14 what is a wholesale transaction and what is not?

15 MR. RICH: Objection, Your Honor. He is
16 asking -- it is a legal question. The witness already
17 stated that requires a legal conclusion and he is not an
18 attorney.

19 ACALJ JIBILIAN: Sustained.

20 BY MR. LOQUVAM:

21 Q. Okay. You testified earlier that all of the
22 benefits in your study are uncertain, right?

23 A. You know, I would not characterize benefits as
24 uncertain. They certainly are based on forecasts. But,
25 you know, the fact that rooftop solar is going to

1 produce fuel savings by displacing natural gas, the fact
2 that it is going to reduce line loadings on the
3 utility's system, I don't think those are uncertain.

4 Q. Okay. Are you familiar with APS's position in
5 this matter regarding the value of solar?

6 A. Yes.

7 Q. And that APS doesn't dispute that rooftop solar
8 displaces the need for other energy sources in terms of
9 actual fuel burn in natural gas and also that line
10 losses provide -- or saved with rooftop solar?

11 A. Yes.

12 Q. So for this discussion, let's not talk about
13 fuel or line losses, because that's a point of agreement
14 I think between the parties. Okay?

15 A. Yes, I think that's right.

16 Q. So I am talking about all of the other benefits
17 identified in your study. Those are all inherently
18 uncertain, correct?

19 A. You know, I am not going to characterize them as
20 inherently uncertain. There is a pretty direct
21 relationship between the growth in the utility's peak
22 demand and adding generation, transmission, and
23 distribution capacity. So to the extent your load grows
24 quickly, you add more infrastructure. To the extent
25 your loads grow less quickly, you add less. And that's

1 not -- I don't characterize, I wouldn't characterize
2 that as uncertain.

3 Q. And that's fair. And I am not saying whether --
4 it is not binary like there are or are not benefits. I
5 am just talking about the overall magnitude or quantity
6 of benefits. That is inherently uncertain, correct?

7 A. Yeah. I don't disagree that, you know, there
8 will be a range of opinions about, you know, for
9 example, what are your marginal transmission costs, what
10 are your marginal distribution costs.

11 Q. And I am not really talking about opinions
12 either. I am talking about a forecast is made and then
13 we don't know if it is accurate or not because we don't
14 actually know until we get to the point that was
15 forecasted, the time.

16 A. And utilities, that's -- they are in the
17 business of doing that all the time. And anytime you
18 add a long-lived new infrastructure, hopefully you have
19 engineers somewhere who are looking at your forecast, is
20 this plant needed, you know, how much is load growing in
21 this area, do I need to reconductor this line, do I need
22 to upgrade this substation, do I need to add this
23 generating facility. All of those questions are matters
24 where you have to look long term into the future and
25 make forecasts.

1 Q. And what are the assumptions used to develop, in
2 your understanding, those forecasts regarding generation
3 capacity?

4 A. Well, you look at what, you know, how much load
5 is growing. You look at, you look at, you know, the
6 resource mix that you have. You look at when plants are
7 going to retire. You know, you look at your resource
8 portfolio, typically the kind of things you look at in
9 an IRP.

10 Q. Does the assumption include projected load
11 growth?

12 A. Yes.

13 Q. And it includes where customers might move?

14 A. Yeah.

15 Q. And it includes customer usage patterns?

16 A. Yes.

17 Q. And all of these are inherently unknowable,
18 correct?

19 A. They are inherently unknowable. But you have to
20 make, you have to take a crack at it if you are going to
21 do, if you are going to do any kind of plan.

22 Q. For planning, you are right. So those forecasts
23 based on those assumptions that are inherently
24 unknowable, those form the basis of your projected
25 benefits, correct?

1 A. You know, I relied upon, to a great extent I
2 relied upon the APS IRPs. So that's, that was a readily
3 available, hopefully internally consistent set of
4 assumptions about your future need for resources.

5 Q. I understand that. It is those forecasts, those
6 uncertain forecasts that form the basis, the exclusive
7 basis of your projected benefits, correct?

8 A. Well, I wouldn't say that I took everything from
9 your IRP, but that was certainly a major source of the
10 data I used.

11 Q. And to the extent that those forecasts are
12 unknowable and those are the basis for your projected
13 benefits, wouldn't the project benefits also be
14 unknowable?

15 A. Well, again, I don't -- I am going to disagree
16 with your characterization of what is in your IRP as
17 something that's unknowable. You know, I don't think
18 you do an IRP if you were just coming up with something
19 that was unknowable.

20 Q. Would you turn to page 9 of your rebuttal
21 testimony. And so I am clear and the record is clear,
22 we discussed generation capacity forecasts, the
23 relationship that we just described between the
24 assumptions of the forecasts and how those drive your
25 benefit calculation, that's true for transmission and

1 distribution capacity as well, correct?

2 A. Well, the T&D benefits that I looked at were
3 basically driven by peak demand estimates both for at
4 the system level and at the individual customer class
5 level for APS.

6 Q. I understand. But I am just saying that
7 previously I limited my question to generation capacity
8 savings, and I just want to know whether the underlying
9 relationships between the forecast and the assumptions
10 and your benefits are consistent within generation, T&D,
11 meaning for distribution you still made assumptions
12 about customer load growth and where customers go and
13 customer usage patterns, and the same for transmission,
14 correct?

15 A. Yeah. I mean the details of the calculations
16 are different for each of those. But, you know, I did
17 make assumptions about the relationship between load
18 growth and those costs.

19 Q. So on page 9, lines 20 to 22 of your rebuttal,
20 you say: Finally, because renewable DG is a long-term
21 resource, evaluating its cost effectiveness necessarily
22 must involve long-term forecasts of many variables which
23 are inherently uncertain.

24 Did I read that correctly?

25 A. Yes.

1 Q. It continues, in addition, the analysis
2 necessarily involves comparing different resource
3 scenarios, many of which will be counterfactual, is that
4 right?

5 A. Yes.

6 Q. So given how we have counterfactual scenarios in
7 a variety of different inherently and uncertain
8 variables, why would it be reasonable for the Commission
9 to rely on your benefit forecasts?

10 A. Well, it is exactly what the Commission does
11 when it assesses any kind of long-term resource. You
12 have to use forecasts and you have to, you have to look
13 at counterfactual examples of, well, if I don't build
14 this plant, what else would I do. And if you, if the
15 plant that you decide to build, you may decide to build
16 it because it is going to be cheaper than some other
17 resource, but you will never build that other resource.
18 That's the counterfactual. You will never really know
19 what that other resource might have cost.

20 But those are the kind of analyses that, you
21 know, we do all the time when we plan long-term
22 resources. This is no different than building a new
23 generating plant or adopting a longer term demand
24 response program.

25 Q. There is a key difference, though, right?

1 Because those other resources that are procured by the
2 utility only fit a specific need, and only actual costs
3 are passed through to customers, correct?

4 A. I don't think demand-side, I don't think
5 demand-side resources are meant to fit a particular
6 need.

7 Q. Well, and I am not -- I am talking about a
8 facility that generates energy and capacity. When
9 utilities procure those, they only pass through actual
10 costs to customers, correct, as a general matter?

11 A. As a general matter, when a utility builds a
12 plant, it passes its just and reasonable costs as
13 determined by the Commission --

14 Q. And isn't that --

15 A. -- through to rate base.

16 Q. -- a key difference between an IRP planning
17 process and the procurement and costs responsibility for
18 new generating facilities?

19 A. A key -- I am not sure. You asked me about a
20 key difference between, I didn't catch what the two
21 things were.

22 Q. The IRP planning process and these future
23 forecasts that drive a lot of your analysis and the
24 notion that customer cost responsibilities is only tied
25 to actual costs.

1 A. No, I don't think there is, I don't think there
2 is a difference there. You know, you can, you can
3 decide to build a new generating plant under a certain
4 set of assumptions and, you know, those assumptions, and
5 it may be cost effective under those assumptions, but
6 those assumptions may turn out to be wrong and you may
7 end up having built a plant that turns out to be more
8 expensive than what you -- the alternatives that you
9 could have built.

10 But, you know, nonetheless you make the effort
11 to assess the benefits and costs before you commit
12 substantial ratepayer dollars.

13 Q. If net metering is sustained as a result of your
14 cost/benefit analysis, that will determine the amount to
15 which non-DG customers pay for this retail rate credit,
16 correct?

17 A. Yeah, that would, yes.

18 Q. So although we talk about -- strike that.

19 Although you talk about in your testimony this
20 is a screening tool to assess the reasonableness of net
21 metering, it is not simply a screening tool; it actually
22 directly translates into the rates paid by non-DG
23 customers, correct?

24 A. In the same way that evaluations of new utility
25 generating plants and finding out whether, finding out

1 whether that investment is reasonable translates
2 directly into costs for ratepayers.

3 Q. Except those are based on actual costs and net
4 metering is not based on actual cost; instead, it is the
5 result of your value analysis and the screening tool?

6 A. Well, what is found reasonable to put in rate
7 base for new, a new electric generating plant is based
8 on the value analysis in the certification and planning
9 process.

10 Q. It is?

11 A. Yeah. You know, that planning process may
12 determine that a nuclear plant that costs \$5 billion is
13 the right thing to put in place.

14 Q. Well, let me stop you there because we are not
15 talking about planning. We are talking about costs
16 being put into rate base and customer cost
17 responsibility.

18 So for purposes of customer cost responsibility,
19 it is the actual facilities and the costs for those
20 facilities, those go through and are paid for by
21 customers, right?

22 A. For a utility owned plant, yes.

23 Q. And net metering, you just testified, if it is
24 sustained, that will directly influence how much
25 customers pay, right?

1 A. Yes.

2 Q. But net metering is not based on costs?

3 A. Because the investment is made by your
4 customers; it is not made by the utility in the case of
5 net metering.

6 Q. I understand that. But non-DG customers are
7 stuck with the bill and net metering is not based on
8 cost, correct?

9 A. Well, it is -- I am not sure what you mean it is
10 not based on costs.

11 Q. You state in your testimony that the goal here
12 is to evaluate exports, right?

13 A. You know, that's certainly what differentiates
14 distributed generation from other types of demand-side
15 resources, are the exports, yes.

16 Q. But your analysis didn't look at export energy;
17 it looked at total production of rooftop solar systems,
18 right?

19 A. Yes, because the analysis is, as I said in my
20 introduction, the analysis is considerably easier if you
21 look at the, at all output rather than just looking at
22 exports.

23 Q. But the data is available, right?

24 A. You know, I haven't tried to do an export only
25 analysis in Arizona. And so I would have to rely on the

1 good graces of companies like yours to get the data to
2 do it.

3 Q. So you didn't try?

4 A. I didn't try, no.

5 Q. In this proceeding?

6 A. In this proceeding, that's right.

7 Q. What would an hourly analysis entail? Would it
8 involve just simply evaluating when the export occurs in
9 relation to utility peak?

10 A. Well, I think that, you know, one, the approach
11 that California took that enabled -- you know, there
12 have been three benefit/cost studies in California that
13 have looked only at exports, one that we did and two
14 that the consulting firm Energy and Environmental
15 Economics did. The reason that those were possible is
16 that the California PUC developed an avoided cost model
17 for the investor owned utilities in California that is
18 an hourly avoided cost model.

19 Q. And I understand that. But I am looking, I am
20 comparing the methodology that you used in your study,
21 which was assessing the total production in connection
22 with the peak. And you used APS's IRP data for that.

23 And so if you were just only to use a subset of
24 the DG production export only, would you similarly just
25 look at what kind of exports occurred during the peak?

1 A. Yeah, possibly. I mean when you say the peak, I
2 have to figure out, you know, what peak hours you are
3 going to look at and things like that. There are a lot
4 of details, but --

5 Q. So maybe the single hour of peak, maybe the top
6 90 hours of peak?

7 A. Or you could -- you know, there is a variety of
8 ways to do it.

9 Q. What way did you do it in your study?

10 A. I used what is called a peak capacity allocation
11 factor, where you look at all the hours that are within
12 one standard deviation of the peak.

13 Q. Okay. And how many hours did that wind up
14 being?

15 A. I think it is somewhere between 10 and
16 15 percent of the hours.

17 Q. And is that what APS used in its IRP?

18 A. I don't think so, no.

19 Q. So you changed the methodology? Although you
20 used APS's numbers about contribution to peak, you
21 applied them to different hours that APS didn't use?

22 A. No, I didn't. No. I think APS has done, did an
23 effective load carrying capacity study. And, you know,
24 I used a methodology that is simpler and more
25 transparent than that.

1 Q. Would you agree that the ELCC, the effective
2 load carrying capacity, is a reasonable way to do this
3 type of analysis?

4 A. It could be. The problem with it, it is not
5 very transparent. You need to use a reliability model
6 that is, you know, requires a lot of assumptions and is
7 not transparent except to the person who uses it.

8 Q. But APS's use of the ELCC produced its IRP, and
9 you relied wholly on APS's IRP. So it was good enough
10 for that, right?

11 A. Well, I didn't say I relied wholly on APS's IRP.
12 I used, you know, some of the data from APS's IRP. In
13 terms of the capacity contribution, I used a different
14 analysis because, you know, that I thought was more
15 transparent.

16 Q. That's actually kind of confusing. Can we go to
17 the study attached to your direct. And on page 6,
18 underneath the paragraph entitled Benefits, just below
19 the middle, you say: However, the 2014 IRP also shows
20 continued growth both in energy efficiency and demand
21 response programs and in distributed solar resources
22 between 2014 and 2019 such that new demand-side
23 resources developed in 2014 to 2019 will contribute 986
24 megawatts to meeting APS's peak demands by 2019.

25 Did I read that correctly?

1 A. Yes.

2 Q. Did you use that 986 megawatt number to develop
3 your projected benefits?

4 A. No.

5 Q. Why did you reference it then?

6 A. Well, I just, I referenced it just for the -- to
7 make the point that energy efficiency, demand responses,
8 and distributed solar, even under APS, the way APS did
9 it in the IRP, is going to contribute a substantial
10 amount of capacity.

11 Q. Are you aware of the split between EE and DG
12 that comprises that 986 megawatts?

13 A. I am sure it is in the IRP. I don't remember
14 what it exactly is.

15 Q. We can answer that question. APS's 2014 IRP is
16 publicly available and I have copied here just simply
17 what is on page 8 of that document, entitled Table 1,
18 summary loads and resources. Do you see that?

19 A. Yes.

20 Q. Is this the same table that you referenced in
21 your study?

22 A. It appears to be, yes.

23 Q. And then on 2019, in the middle it says energy
24 efficiency, 877 megawatts; distributed energy, 109
25 megawatts, for a total of 986. Did I read that

1 correctly?

2 A. Yes.

3 Q. So does this mean that the split is actually
4 heavily weighted towards energy efficiency?

5 A. Yes.

6 Q. Earlier you discussed the concerns with the ELCC
7 and transparency. It is a commonly used tool in the
8 industry, is that right?

9 A. Yeah. It is widely used, yes.

10 Q. And has there been a systemic concern about its
11 accuracy?

12 A. Yes, I think there are systemic concerns about
13 its accuracy.

14 Q. Continuing concerns or historical concerns?

15 A. I would say both.

16 Q. So it is your testimony today that the ELCC is
17 too flawed to use?

18 A. Yeah, my testimony is that there are, there are
19 other methods to assess the capacity value of solar
20 resources that are much more transparent than ELCC.

21 Q. Okay. Setting aside transparency, I am talking
22 about accuracy. On the basis of accuracy, do you think
23 ELCC is a reasonable way for utilities to plan?

24 A. You know, I have my doubts about whether it is.
25 There are a number of issues about, you know, for

1 example, how scheduled maintenance is used in ELCC
2 studies. There are issues about using weather
3 normalized and particular meteorological year data in
4 ELCC studies instead of using actual load and resource
5 data that I think make it problematic.

6 Q. Export energy is different than self-consumed
7 energy, right?

8 A. Yes.

9 Q. And the difference is -- can you describe the
10 differences?

11 A. Well, self-consumed energy is the portion of DG
12 output that's used by the customer on-site, and export
13 is what is sent out to the grid.

14 Q. And would you agree that the timing between the
15 two is different viewed from a system perspective?

16 A. There are some timing differences, but, you
17 know, whether they are material or not I think is an
18 empirical question.

19 Q. Meaning data would determine that?

20 A. Yeah.

21 Q. Are you familiar with Brad Albert's testimony in
22 this matter?

23 A. Yes, I did review that.

24 Q. And his rebuttal testimony where he describes
25 the timing differential between export and self-consumed

1 energy?

2 A. Yes.

3 Q. If you could, turn to that. It is his rebuttal
4 testimony, page 16. I am not sure which exhibit that
5 is. I think it is 6.

6 ACALJ JIBILIAN: It is APS-6.

7 THE WITNESS: Okay. I have his testimony.

8 BY MR. LOQUVAM:

9 Q. So if export energy occurs at a different time
10 than self-consumed energy, would that have different
11 implications for capacity benefits provided by rooftop
12 solar energy?

13 A. I mean, if you do your capacity avoided cost on
14 an hourly basis, it could have a difference, yes.

15 Q. And would that be material for purposes of
16 assessing the value of solar?

17 A. Well, again, you know, I have -- E-3 did a net
18 metering study in California using an hourly avoided
19 cost model, and they found very little difference in the
20 avoided cost between exports only and all output --

21 Q. Did you create that study?

22 A. I didn't create it. I --

23 Q. Did you understand what the methodology was
24 behind it?

25 A. Absolutely, yes.

1 MR. LOQUVAM: Your Honor, I move to strike his
2 references to this study. If we want to have it
3 introduced, I am happy to look at it, but I think it
4 is -- it distorts this discussion because we don't have
5 any ability to assess its assumptions.

6 MR. RICH: Your Honor, well --

7 MR. LOQUVAM: It is also hearsay.

8 MR. RICH: This is an administrative proceeding
9 and we have a tremendous amount of hearsay that has been
10 introduced to date.

11 He said he understands the study. I am not sure
12 that -- I would be happy to review the last question to
13 see what gave rise to that, but I don't believe there is
14 any reason to strike it.

15 MR. LOQUVAM: My point is solely that there is
16 these broad claims on topics that are central here that
17 we don't have the ability to actually look at any of the
18 these assumptions. They are just kind of from the hip:
19 Oh, this was said.

20 MR. RICH: Your Honor, the time to object to the
21 testimony is long since passed obviously as well.

22 MR. LOQUVAM: The first time the E-3 study from
23 California was mentioned was this morning in his intro.

24 MR. RICH: And he testified he is very familiar
25 with it.

1 MR. LOQUVAM: And I am not worried about his
2 interests.

3 ACALJ JIBILIAN: I would like to go back to the
4 question that elicited the response, and the response,
5 too, if you could read it.

6 (The record was read by the reporter as
7 requested as follows:

8 Question: And would that be material for
9 purposes of assessing the value of solar?

10 Answer: Well, again, you know, I have --
11 E-3 did a net metering study in California using
12 an hourly avoided cost model, and they found very
13 little difference in the avoided cost between
14 exports only and all output --)

15 ACALJ JIBILIAN: I don't feel it is necessary,
16 it is not necessary to strike the answer. However,
17 since that study is not in evidence, I don't see what
18 legal argument could be made based on that study. So
19 that's -- I don't think that we need to strike the
20 answer to have that result.

21 MR. LOQUVAM: Fair enough.

22 BY MR. LOQUVAM:

23 Q. That study, the E-3 study, was based on
24 California data and California utility specific peak
25 information, is that right?

1 A. Yes.

2 Q. But other than that study based on California
3 information, would you agree that if export energy
4 occurs at a different time than self-consumed energy it
5 would have different implications for capacity savings
6 for the utility in question?

7 A. I am going to say it could, but, again, that's
8 an, it is an empirical question. And, you know,
9 generally, if you look at, for example, if you look at
10 in my testimony Figure 5 that we talked about, the three
11 states of net metering, you know, exports tend to happen
12 more in the middle of the day, whereas the
13 self-consumption can take place over the full period in
14 which the system is producing. So you may get more
15 self-consumption first thing in the morning and in the
16 evening.

17 You know, the self-consumption in the evening
18 could be quite valuable. So could the solar generation
19 that takes place in the middle of the afternoon. So,
20 again, it is something, the exports that take place in
21 the middle of the afternoon could be quite valuable as
22 well. Again, it is an empirical question. You need to
23 look at it --

24 Q. Sure.

25 A. -- with the detailed data.

1 Q. Sure. We are focusing on exports, though,
2 right?

3 A. Yeah. If you just focused on exports, and to
4 find out whether there was any significant difference
5 between exports and all generation, you know, you would
6 need to do the study both ways and then see if there is
7 a difference.

8 Q. And utilities build towards to serve peak demand
9 and load, right?

10 A. For generation and transmission. For
11 distribution they tend to build for peak demand at a
12 more localized basis.

13 Q. Okay. But it is demand, whether it is
14 noncoincident or coincident demand, that's what they
15 build towards, right?

16 A. Yes.

17 Q. And are you familiar when APS's peak demand was
18 in 2015?

19 A. I think I saw some data on that. And I believe
20 you have been peaking in the hour between 4:00 and 5:00
21 p.m. in the afternoon.

22 Q. If I -- well, I will represent to you it is on
23 August 15 at 5:00 p.m. last year. And that's in
24 Mr. Albert's testimony, subject to check, if you will
25 accept that.

1 A. Yeah.

2 Q. So let's actually talk about Figure 5 on page 11
3 of your direct. And I don't have a ruler, but that
4 solar output, the sort of uncolored line above, when did
5 that end, when did that export end in this diagram?

6 A. You know, it ended about 5:00 p.m.

7 Q. So I know this is not APS's. This is an
8 illustrative. But if this were the profile of a typical
9 rooftop solar customer for APS customer in 2015, would
10 that mean that export energy did not contribute to APS's
11 peak needs if this was an August 15 day?

12 A. Well, if it was, if it was, if your peak was
13 at -- well, first all, let me -- it might not have
14 contributed to the peak hour, but it would have
15 contributed to the hours immediately before the peak.
16 And those can be, you know, very important hours, too.

17 In my -- and I think most utility planners
18 realize that you don't look just at the peak hour; you
19 look at the set of hours that are most critical for the
20 system.

21 Q. To determine using an ELCC?

22 A. Well, that can be one way to do it, or the PCAF
23 method that I use could be another way.

24 Q. But for this day in particular, it did not
25 contribute to peak?

1 A. You know, I also observe that this shows a
2 south-facing PV system. For example, the PV system
3 that's on my house is almost due west, and it peaks at
4 3:00 p.m. in the afternoon.

5 Q. I understand. I am focusing on this diagram
6 right here, south-facing system.

7 A. That's right.

8 Q. It didn't have any export at 5:00 p.m., which,
9 if this was an APS scenario, it would not have
10 contributed to APS's peak demand on that day?

11 A. To that one peak hour it would not have
12 contributed, yes.

13 Q. And then I think I asked you to turn to
14 Mr. Albert's rebuttal testimony, to page 16, lines 20 to
15 25. It says:

16 And when APS hit its annual peak load at 5:00
17 p.m., rooftop solar was exporting only 8.8 megawatts to
18 the grid, or about 5 percent of the aggregate nameplate
19 capacity of all residential rooftop solar systems over
20 the course of the day. Rooftop solar customers
21 self-consumed 74 percent of their solar output and only
22 exported 26 percent.

23 Did I read that correctly?

24 A. Yes.

25 Q. So for purposes of APS's peak demand in 2015, on

1 that peak hour, would you agree that only 8.8 megawatts
2 of exported rooftop solar energy should be counted for
3 purposes of peak demand reduction?

4 A. No. I think, as I just testified, you are
5 talking about one peak hour. And the contribution of
6 solar to reducing the peak should not be measured just
7 on the contribution to this, to one peak hour. It
8 should be measured more broadly across a broader set of
9 peak hours.

10 Q. I understand that. And so would you agree that
11 if that peak contribution was measured over the broader
12 number of hours, would that be an accurate data set for
13 purposes of establishing how export energy contributes
14 to peak demand reduction?

15 A. I mean it would be -- I mean we would have to
16 obviously agree on the details.

17 Q. Why wouldn't it be?

18 A. Well, I think we just had a discussion about
19 whether -- you know, various methods for looking at
20 contribution to peak and, you know, there are different
21 approaches. We just had a discussion about whether ELCC
22 is a good approach or not. So I would reserve judgment
23 on the approach used.

24 Q. Fair enough. But let's say we use the top 90
25 hours of a utility's peak in a given year, meaning, you

1 know, based on actual data, metered data, it is only the
2 top 90 hours, which is a lot of hours. Would it be
3 reasonable to aggregate and look at the data for export
4 energy on those top 90 hours and say this is the only
5 data set we need to establish whether and how export
6 energy contributed to peak demand?

7 A. You know, I am not going to commit to the top 90
8 hours either. That's only 1 percent of the top hours.
9 My judgment is it should be a broader set than that.

10 Q. How much broader?

11 A. Well, the method I used looks at 10 to
12 15 percent of the top load hours. So it is a broader
13 set.

14 Q. And doesn't that dramatically increase the value
15 of exported energy?

16 A. I didn't do an export only analysis. So I can't
17 say.

18 Q. But you agree that if you had done it, it would
19 have resulted in a different conclusion than your look
20 at total production, right?

21 A. No, I am not going to agree to that.

22 Q. Oh, come on.

23 Have you heard testimony regarding peak shifting
24 with further solar contribution?

25 Sorry. That was a really poor question. There

1 has been testimony in this matter regarding the notion
2 that the peak might shift as additional rooftop solar
3 and actually grid scale solar is installed on a system.
4 Have you heard that testimony?

5 A. I am aware of that concept, yes.

6 Q. Do you subscribe to that concept? Do you
7 understand or believe it or can you comment on it?

8 A. It certainly can happen. You know, I have
9 actually looked at the data for Hawaii. And you can see
10 a shift in the peak in Hawaii, where they have,
11 20 percent of customers have rooftop solar. But it
12 takes, it takes a pretty high penetration of solar to
13 start to see that happen. I have looked for it in
14 California. Very hard to ascertain at this point, even
15 in California where we are at, you know, 5 percent
16 penetration.

17 So it can happen. It also can be mitigated by
18 things like west-facing systems. Or a small amount of
19 storage combined with storage can, would have a big
20 effect on that effect.

21 Q. Let's limit our discussion to rooftop solar
22 however. You are saying that it is possible that peak
23 shift occurs, it just requires a lot of solar
24 penetration?

25 A. Yes.

1 Q. And once that peak shift occurs, would you agree
2 at that point when the utility's maximum peak is
3 occurring at night, solar is not contributing to peak
4 reductions?

5 A. It takes a lot of solar to bring that about.

6 Q. Understand.

7 A. But if -- you know, my guess is that it would,
8 there would probably be some hours that there would be
9 some contribution leading up to a nighttime peak. But
10 obviously, if the peak is happening at nighttime,
11 solar's contribution to that would be substantially
12 less.

13 Q. Zero? It is at night.

14 A. Again, I, you know, I --

15 Q. I am only talking about rooftop solar.
16 Batteries I get; inverters, that's a different
17 discussion. Rooftop solar nighttime production is zero,
18 right?

19 A. Nighttime production is zero.

20 Q. And if the peak is at night, then the production
21 and contribution to peak at that time is zero, right?

22 A. Again, you know, my view is that it is not just
23 the peak hour, it is the hours leading up to the peak.
24 So if there are hours leading up to the peak that also
25 are high-demand hours and it is still daytime, then

1 there still could be a contribution.

2 Q. When utilities make planning decisions to build
3 particular facilities, they use a set number of hours,
4 right? I mean that's just what they do. Whether you
5 agree with that or not, I understand you have
6 disagreements with the methodology, but that's actually
7 the costs they go incur, is that right?

8 A. Was your question do utilities have certain
9 approaches to calculating a peak capacity contribution?

10 Q. I am focused more on the fact that they go build
11 to establish the peak that they believe exists or their
12 peak demands that they have developed with their
13 methodologies.

14 A. Well, a peak demand is something that's
15 recorded. I don't --

16 Q. We are talking about forecasting.

17 A. I am not understanding your question.

18 Q. Okay, fair enough. It was probably unclear.

19 Utilities develop plans on future capacity needs
20 and then make procurement decisions based on those
21 forecasts, right?

22 A. Yes.

23 Q. And it is their forecast, for instance, we need
24 to serve XYZ load over the next several years because
25 our forecasts for the peak demand during the hours in

1 question is X, right?

2 A. Yes.

3 Q. So if a utility is using the top 90 hours,
4 that's the measuring stick for that particular utility
5 in terms of the costs saved if rooftop solar reduces
6 peak demand, right, regardless whether you disagree with
7 the underlying methodology, right?

8 A. I am having a hard time understanding what the
9 utility is using the top 90 hours for. I mean your peak
10 demand is -- I mean it is possible that the utility
11 could use a measure of peak demand that's different than
12 just the load in the absolute peak hour to -- as a
13 metric for how much capacity it needs on its system.

14 Q. I am pretty sure my question was unclear.

15 So when you do your value of solar study for
16 APS, you are looking at APS's forecast for what their
17 future capacity needs are, and you calculate a value of
18 rooftop solar based on APS's stated plans for what it
19 will build into the future, right?

20 A. Yes. I look at that to -- for example, to pick
21 the, to pick the value of capacity, you look at the kind
22 of resources that APS is going to add in the future,
23 like a combustion turbine.

24 Q. And the timing of those based on APS's
25 assessment of when peak demand will need additional

1 resources, right?

2 A. To some extent we look at that; although, you
3 know, it is my view that you should look at the value of
4 capacity on kind of a continuous basis, as we have
5 discussed earlier.

6 Q. Fair enough. But I am focusing more it is APS's
7 procurement decision that you are analyzing.

8 A. Yeah. I would, for example, I look at the IRP,
9 and APS is adding the Ocotillo combustion turbine units.
10 And so that's what I -- the way I modeled my marginal
11 resource --

12 Q. And so --

13 A. -- capacity.

14 Q. -- if APS has established that capacity plan,
15 then although you might have disagreements with APS's
16 use of whatever planning methodology it uses, it is what
17 it is, that's the actual capacity that's the bogey for
18 purposes of establishing whether benefits will actually
19 materialize in APS's service territory as a result of
20 rooftop solar, right?

21 A. Well, that's what I used to calculate the
22 marginal cost of generation capacity.

23 Q. So it renders moot whether you disagree with the
24 ELCC or not because that's actually what APS is going to
25 act on, so that's actually what the facts are going to

1 be that you rely on, right?

2 A. No. I used that to establish the marginal cost
3 of generating capacity. The capacity contribution of
4 solar is based on my PCAF calculations, which is like we
5 have gone through. It is based on a somewhat broader
6 set of peak hours than the peak hour or the top 90 peak
7 hours, and that determines what percentage of nameplate
8 capacity of rooftop solar should be assumed to meet
9 APS's peak demand needs.

10 Q. Using a different set of hours than what APS
11 will actually act on seems to be putting your thumb on
12 the scale, doesn't it?

13 A. No, because the -- what we are trying to do here
14 is assess a customer-sited resource with an intermittent
15 technology. And we are trying to look at the
16 characteristics of that particular resource, I mean in
17 comparison to a combustion turbine where you know that a
18 100 megawatt combustion turbine is going to generate 100
19 megawatts when you turn it on.

20 Q. Externalities aren't included in a cost of
21 service, right?

22 A. Probably not, no.

23 Q. Probably not or no?

24 A. Well, you know, I guess by definition the word
25 externality means it is external to the utility's cost

1 structure. So I would say no, it is not included.

2 Q. And there is no carbon tax or other source of
3 immediate environmental cost that flows through the cost
4 of service other than, for instance, maybe facilities
5 like a selective catalytic reducer, right?

6 A. You don't install that for carbon. That doesn't
7 take the CO2 out of your --

8 Q. Fair.

9 A. -- flue gas.

10 Q. Other than sort of facilities, there is no other
11 environmental costs that flow through the cost of
12 service?

13 A. Not Arizona, to my knowledge today.

14 Q. And so to the extent that those don't flow
15 through the cost of service, customers aren't going to
16 be responsible for those costs, right, through their
17 utility rates?

18 A. In the short run, probably not.

19 Q. So when we assess and compare the difference
20 between grid scale and rooftop solar facilities and the
21 value of those two types of energy sources,
22 externalities are irrelevant, right?

23 A. No, I would disagree with that. I think that
24 there are different sets of externalities that apply to
25 utility scale solar as opposed to rooftop.

1 So, for example, both utility scale and rooftop
2 may have the same effect on reducing carbon. But
3 rooftop solar has other external benefits that should be
4 considered that utility scale doesn't. One of them is
5 improving reliability and resiliency. Utility scale
6 solar can't be part of a local microgrid that can enable
7 critical loads to remain in service even if there is an
8 outage to the utility system, whereas DG solar can. And
9 that's a benefit, kind of an externality benefit of DG
10 solar that rooftop solar does not have, I mean utility
11 scale does not have.

12 Q. Can you quantify that microgrid benefit?

13 A. I have quantified it in other testimony. I
14 don't believe I quantified it in this testimony.

15 Q. I don't think you did either.

16 Rooftop solar and grid scale provide the same --
17 involve the same technology, right?

18 A. Basically, yes.

19 Q. And they both produce energy fueled by solar
20 energy, right?

21 A. Yes.

22 Q. And so from the perspective of all other
23 customers, wouldn't, if the goal is to increase the
24 amount of solar, wouldn't grid scale solar be a more
25 cost effective way to obtain the value of solar?

1 A. No, because it is not necessarily -- because it
2 is, you know, located in a different place than rooftop
3 solar. Rooftop solar serves loads directly. And the
4 power that doesn't serve the load on-site is exported to
5 the grid where it is immediately consumed by the
6 neighbors. That's a lot different than a utility scale
7 plant that's located remotely, where the power has to be
8 transmitted and distributed over the utility system to
9 the customers.

10 Q. But an apples to apples comparison between the
11 two types of solar applications is possible, right?

12 A. Yes. You can, you can certainly, you can add
13 the marginal T&D costs onto the utility scale cost.

14 Q. So if the marginal T&D costs, after adding those
15 to the value of rooftop solar, still don't come out
16 ahead, wouldn't grid scale solar be the best option if
17 the Commission is interested in furthering the
18 penetration of solar in Arizona?

19 A. Well, I think that, you know, I think you should
20 look at those numbers and see what the comparison is.
21 And they may not be as far off as you -- when I looked
22 at that issue in Colorado, the numbers were not
23 significantly different.

24 And then there also are a lot of policy issues
25 that I set forth in my testimony in terms of customer

1 engagement and new sources of capital and competition
2 and customer choice that also need to be considered.

3 Q. I understand, the Jeffersonian ideal of the
4 solar farmer.

5 A. Yes.

6 Q. I understand that. My question is focused on
7 cost and actual customer bills. These are real families
8 who have to decide where they are going to spend what
9 they make. And they are going to buy food and clothing
10 for their children and school and energy costs.

11 And so when the Commission is assessing what is
12 the most cost effective way to increase the amount of
13 rooftop solar penetration, if we gross up the costs or
14 the benefits of rooftop solar to account for T&D, and
15 grid scale is still better, wouldn't that be the better
16 policy option for the Commission?

17 A. Well, you also -- there is also a demand among
18 customers to increase, to be able to be served by a
19 higher penetration of renewables. And you just can't
20 meet that with utility scale solar unless you are going
21 to, you know, do a program where you directly allocate
22 the utility scale solar power to the customer.

23 Q. Demand by customers who have average credit of
24 760?

25 A. You know, whatever. But you can't meet the

1 demand of customers to be served by a higher penetration
2 of renewables with utility scale solar unless you have
3 some kind of community solar or program.

4 Q. On a cost basis you conclude that south-facing
5 solar, excluding externalities, is a net cost to all
6 customers, right?

7 A. The benefits of south-facing solar are not quite
8 as high as the benefits of west-facing. So I think
9 that, you may be right, that it is slightly less than,
10 slightly less than the cost. I think the costs are like
11 17 cents and benefits of south-facing were 16, something
12 like that.

13 Q. Page 22 of your study, and 23, the costs are
14 17.9 based on your analysis, whereas the benefits of
15 south-facing solar, excluding externalities, stuff that
16 does not flow through the cost of service, is 15.5, is
17 that right?

18 A. Yes, that's right.

19 Q. So in that circumstance, with south-facing
20 systems being a net cost to all other customers, would
21 you agree that south-facing systems shouldn't get net
22 metering?

23 A. No. You know, I think what it means is that you
24 might want to think about a program that incents
25 customers to install west-facing systems that have

1 significantly higher value.

2 Q. Wouldn't net metering do that? If we canceled
3 net metering for south-facing systems and only give it
4 to west-facing systems, wouldn't that do that?

5 A. No. One thing you could do is require net
6 metering customers to take service under time-of-use
7 rates. And that will give people a strong incentive to
8 face their systems west.

9 Q. But if they install them south nonetheless, then
10 it is a net cost. So in that circumstance, under your
11 own standard for at what point net metering should
12 continue, shouldn't net metering be terminated for
13 south-facing systems?

14 A. You know, I think that would be, when you -- I
15 am not sure. What would you replace it with? If the
16 difference between the cost and benefits is only a
17 penny, you know, and the, or two pennies, the costs are
18 roughly 18 cents and the benefits are 16 cents, you
19 know, it wouldn't make sense to terminate net metering
20 and only compensate them 2 cents.

21 Q. I understand that, sir. But even the benefits
22 you have established are full of putting your thumb on
23 the scale, using different methodologies and trying to
24 expand these benefits as much as you can as an expert on
25 behalf of the Vote Solar, and we are still below the

1 cost that you identify. So why shouldn't net metering
2 be cancelled for south-facing systems?

3 A. Because there are other things you can do. You
4 could require time-of-use rates so you will get more
5 west-facing systems. And my analysis shows that the
6 costs of net metering for under time-of-use rates are
7 about a penny below the cost under nontime-of-use rates.
8 So you will help address -- if you think that there is a
9 net cost, you can address it by requiring time-of-use
10 rates.

11 You also can do things like putting on a minimum
12 bill so that customers who install large systems
13 relative to their usage will contribute to a minimum
14 amount of costs.

15 Those two recommendations I make, I think, would
16 bridge that difference that you just pointed out.

17 Q. Okay. But you wouldn't apply your standard of,
18 if net metering is considered to be cost effective based
19 on a cost/benefit analysis it should continue, you
20 wouldn't apply the reverse of that; is that what your
21 testimony is today? Instead, you would say no, we
22 should continue to install south-facing systems but,
23 instead, just apply other solutions?

24 A. Well, that's why we are doing this test, is to
25 find out whether we need to make adjustments to things

1 like rates --

2 Q. And not net metering?

3 A. -- and rate design.

4 Q. I thought that's what the discussion was.

5 A. No. You can affect the balance of cost and
6 benefits for net metering through rate design. You
7 don't have to get rid of net metering.

8 Q. But meanwhile, if net metering persists for
9 south-facing systems, all non-DG customers will be
10 paying in the short term increased rates to fund net
11 metering, right?

12 A. Well, there also are, you know, societal
13 benefits, which are significant. And the Commission
14 needs -- if the -- if you are short by a penny or two,
15 the Commission should evaluate whether it is worth
16 funding that cost shift because of the external
17 benefits. For example, energy efficiency programs often
18 raise rates for customers. And commissions accept that
19 because of, because of the external benefits of energy
20 efficiency.

21 Q. And, meanwhile, the benefits that you have
22 identified here that still don't overcome the stated
23 costs are based on forecasts that are inherently
24 uncertain, right?

25 A. Forecasts always have a certain amount of

1 uncertainty.

2 Q. And what if those forecasts are wrong and
3 customers without DG will have been paying that,
4 something you even admit is not cost effective, isn't
5 that unfair? Doesn't that raise issues of equity?

6 A. Well, the forecasts could be wrong in the other
7 direction, too. Natural gas rates could go, natural gas
8 prices could go up substantially. It could turn out
9 that climate change is actually happening faster than we
10 think. So, you know, forecasts are inherently
11 uncertain. Sometimes they turn out to benefit people as
12 well as cost people.

13 MR. LOQUVAM: Thank you, Your Honor. No further
14 questions.

15 ACALJ JIBILIAN: Would you like to move your
16 Exhibits APS-14 through 16?

17 MR. LOQUVAM: Please, Your Honor, I move all of
18 those for admission.

19 ACALJ JIBILIAN: Is there any objection?

20 (No response.)

21 ACALJ JIBILIAN: APS-14 through 16 are admitted.

22 (Exhibits APS-14 through APS-16 were admitted
23 into evidence.)

24 ACALJ JIBILIAN: And would AIC like to move its
25 exhibits?

1 MS. GRABEL: I would, Your Honor. Thank you.

2 ACALJ JIBILIAN: AIC-8 through AIC-17, is there
3 any objection?

4 (No response.)

5 ACALJ JIBILIAN: AIC-8 through 17 are admitted.

6 (Exhibits AIC-8 through AIC-17 were admitted
7 into evidence.)

8 ACALJ JIBILIAN: And after we come back from
9 lunch, I hope to hear from the parties regarding any
10 procedural recommendations. We will see you back here
11 at 1:30.

12 (A recess ensued.)

13 (Colette Ross, Certified Reporter, was excused
14 from the proceedings.)

15 (TIME NOTED: 12:24 p.m.)

16

17

18

19

20

21

22

23

24

25

1 (The afternoon session resumed at 1:30 p.m.,
2 reported by Gary W. Hill, Certified Reporter.)

3 ACALJ JIBILIAN: Let's just go back on the
4 record, and there were some procedural issues that the
5 parties wanted to raise before we continue with the
6 cross-examination.

7 MS. SCOTT: Your Honor, we have relooked at some
8 of the dates for the resumption of the hearing in
9 June --

10 ACALJ JIBILIAN: Okay.

11 MS. SCOTT: -- and we're now looking at June 8
12 for foundational testimony by APS and TEP and UNSE.

13 ACALJ JIBILIAN: For TEP and UNSE, a different
14 case?

15 MS. SCOTT: No, they have responses to the same
16 data requests.

17 ACALJ JIBILIAN: Oh, okay. I'm sorry, I
18 thought --

19 MS. SCOTT: And so they will be presenting their
20 responses on that day as well as APS.

21 ACALJ JIBILIAN: So TEP, UNSE and APS will each
22 have a witness on June 8?

23 MS. SCOTT: Yes.

24 ACALJ JIBILIAN: Okay.

25 MR. PATTEN: I think our witness would be one

1 witness for TEP and UNS.

2 ACALJ JIBILIAN: Right.

3 MS. SCOTT: And then we would propose, Your
4 Honor, that parties have the option of either filing a
5 written response to the testimony that's presented that
6 day or, if they want, they can present a witness to
7 submit responsive testimony, and the date that we're
8 looking at for that is June 13th.

9 ACALJ JIBILIAN: Okay.

10 MS. SCOTT: And then we've also looked at a
11 briefing schedule, and I think everyone is in agreement
12 that since we have most of the evidence on all of the
13 issues except this one outstanding issue, parties can
14 start working on the briefs after the close of today's
15 hearing. And so we've agreed to an opening briefing
16 date of June 20th, which is a week after the witnesses
17 appear on the 13th.

18 ACALJ JIBILIAN: Okay.

19 MS. SCOTT: The reply brief has been subject to
20 some discussion. I think most people can do it on the
21 30th or, I believe, the 1st; however, Mr. Rich would
22 like additional time, I think. So that's -- we're still
23 more or less talking about that date.

24 ACALJ JIBILIAN: What date do you propose,
25 Mr. Rich?

1 MR. RICH: Your Honor, I was proposing the 8th.

2 ACALJ JIBILIAN: Okay.

3 MR. RICH: There are several -- there's another
4 brief and several other things that are due the end of
5 June, and I'm just trying to manage that schedule. And
6 then I know that caused RUCO heartburn because they were
7 not going to be in the office, I believe -- I'll let Dan
8 answer for himself -- but on the 8th. And so he
9 suggested if it was the 8th, then it should be the 11th,
10 that Monday.

11 ACALJ JIBILIAN: But -- okay.

12 MR. PATTEN: Your Honor, I don't agree with
13 Mr. Rich on many things, but the 8th would be preferable
14 as well.

15 ACALJ JIBILIAN: And, Mr. Pozefsky, you would be
16 willing to do it on July 1st?

17 MR. POZEFSKY: Right.

18 ACALJ JIBILIAN: Well, could you just get it
19 ready and have someone file it for you on the 8th?

20 MR. POZEFSKY: Well, I don't know that, Your
21 Honor, because normally that would be Jordy Fuentes, but
22 he's going to be out of the office, too, that week.

23 ACALJ JIBILIAN: Well, I mean, couldn't you have
24 it all ready to go and just have an administrative
25 assistant do the filing?

1 MR. POZEFSKY: You know, without speaking to,
2 again, my experts, et cetera, I just don't know. I'm
3 kind of --

4 ACALJ JIBILIAN: I think that the 8th seems
5 perfectly acceptable. So somehow, I think, that you
6 might be able to get it done. If you were willing to do
7 it on the 1st, I don't see the problem with the 8th.

8 MR. POZEFSKY: Okay. I guess that decides it.

9 ACALJ JIBILIAN: Okay. So we do have this room
10 available on June 8th and also on June 13th.

11 Would there be prefiled testimony or would the
12 testimony just be from the stand? Is that something
13 that the parties have discussed?

14 MR. LOQUVAM: Our intention is to submit the
15 data request to the parties who signed the order, and
16 I'm not sure if Mr. Patten has different ideas or
17 thoughts, but then just to lay a foundation verbally.

18 ACALJ JIBILIAN: Okay. So the actual
19 information will be made available prior?

20 MR. LOQUVAM: Next week.

21 ACALJ JIBILIAN: And I haven't seen that
22 proposed form of order, but I assume I'll get it next
23 week, and that's fine.

24 MR. LOQUVAM: That's right.

25 ACALJ JIBILIAN: Okay.

1 MR. RICH: Your Honor, could I just inquire --

2 ACALJ JIBILIAN: Yes.

3 MR. RICH: -- to each of the companies?

4 Do both of you believe you'll be responding to
5 that next week then --

6 MR. LOQUVAM: Yes.

7 MR. RICH: -- to those that have signed? APS,
8 yes.

9 MR. PATTEN: It will be sometime next week.

10 MR. RICH: Okay.

11 MR. PATTEN: Not necessarily early in the week,
12 but --

13 MR. RICH: Sure.

14 ACALJ JIBILIAN: All right. Any other
15 procedural issues?

16 MR. POZEFSKY: I guess I just wanted to mention.
17 I don't know if we will file or put a witness on in
18 response to that. I just don't know what our position
19 is. So it's possible we may not do either, because this
20 seems to be between the solar and the companies. So
21 we'll see. I just can't tell at this point.

22 ACALJ JIBILIAN: Okay. And that's perfectly
23 acceptable, and there are lots of parties to this case
24 who have participated that aren't here today, and if
25 you're listening, then that's something that --

1 participation in that next phase of this hearing is
2 optional, of course. I appreciate participation, but if
3 that's not something that the parties need to do, then I
4 understand that.

5 MR. POZEFSKY: Okay.

6 ACALJ JIBILIAN: Not everyone would be required
7 to put on a witness.

8 MS. SCOTT: And, Your Honor, the other thing is,
9 I did talk to the parties about if Staff does file a
10 written response rather than presenting a witness, we
11 might want a day or so after the 13th to do that.

12 ACALJ JIBILIAN: Okay. And we can discuss that
13 at the time.

14 MS. SCOTT: Okay.

15 MR. LOQUVAM: And the other sort of issue that
16 we probably don't need to resolve today is just knowing
17 at what point we are going to come and how many
18 witnesses we'll be crossing, and those sort of resources
19 or whether everyone says, you know, we'll just do this
20 in writing and then we can cancel the 13th.

21 ACALJ JIBILIAN: Sure, any time that the parties
22 want to have a telephonic procedural conference, all you
23 have to do is contact the Hearing Division, and we can
24 set one up.

25 Okay. Let's get back to the evidentiary portion

1 of the proceeding, and I believe, Mr. Pozefsky, it would
2 be RUCO's turn for cross-examination.

3 MR. POZEFSKY: Thank you, Your Honor.
4

5 CROSS-EXAMINATION

6 BY MR. POZEFSKY:

7 Q. Good afternoon, Mr. Beach. How are you?

8 A. Good afternoon.

9 Q. I just want to start out by asking you a couple
10 questions in relation to your summary that you made
11 earlier this morning. You talked about a couple rate
12 designs that you believed were acceptable and a couple
13 that weren't of note. The ones that weren't were the
14 fixed charge and the demand charge, and the ones that
15 were would be the minimum bill and the TOU?

16 A. Yes.

17 Q. Is that correct?

18 A. Yes.

19 Q. When you come up with that, does it matter what
20 the actual charge is, meaning, the minimum bill is
21 acceptable no matter what the minimum bill is?

22 A. No. I think you would have to -- the magnitude
23 would also be important.

24 Q. Okay. So if you had a situation where doing
25 this, the minimum bill was actually more than the fixed

1 charge, that may not be appropriate?

2 A. Yeah. You could do a -- I'm sure you could come
3 up with a scenario where, you know, a really high
4 minimum bill versus a very small fixed charge, and, you
5 know, so the magnitude does matter.

6 Q. Okay. And you also said a TOU would be
7 acceptable. Can you elaborate a little bit more on
8 that? What type of TOU?

9 A. Well, there could be a variety of different
10 time-of-use rates. You could have time-of-use rates as
11 they exist today where you typically have an on-peak
12 period and an off-peak period; and sometimes they're
13 differentiated by seasons so you have summer and winter
14 rates as well with a higher on-peak rate and a lower
15 off-peak rate, all volumetric.

16 There also are what are sometimes described as
17 dynamic pricing time-of-use rates where you might have a
18 relatively high on-peak rate for a limited period of
19 time on a set number of high demand days that are called
20 in advance. It's typically called critical-peak
21 pricing. It's being implemented in California and a
22 number of other states. So that's another type of
23 time-of-use rate that might be considered.

24 Q. Is there any type of time-of-use rate that's
25 more preferable over another type of time-of-use rate

1 from your standpoint?

2 A. Well, probably the, you know, the -- I mean, APS
3 is sort of a, has a lot of experience with time-of-use
4 rates and they have a lot of their customers on
5 time-of-use rates. So the simpler two-period rates, all
6 volumetric, those I think have been the most popular,
7 and that would certainly be the place to start.

8 And for example, California recently in their
9 net metering order, they decided that for customers
10 above the net metering cap in California that installed
11 DG, they would be required to be on a time-of-use rate.

12 Q. Okay. You also say in your summary that the
13 focus of this value of solar docket should be on
14 exports.

15 Do you recall that?

16 A. Yes.

17 Q. You would agree with me, would you not, that one
18 of the more significant benefits of DG solar is the
19 off-setting the need for additional generation?

20 A. Yes.

21 Q. Okay. And those benefits would include or would
22 be related to both the on-site consumption and the
23 exports, correct?

24 A. Yes, and it's possible that -- you might even
25 have a situation where the value of the exports is lower

1 than the value of the generation that serves on-site
2 load. I mean, you would have to -- you know, it all
3 would depend on the numbers and the various load
4 profiles of the customers.

5 Q. Okay. And for most DG systems, most of the
6 energy or most of the output is associated with the
7 on-site generation than it is with the exports, correct?

8 A. It depends -- that depends on the type of
9 customer who is being served, what their load profile
10 is, the orientation of their system. So it's generally,
11 I mean, this is speaking very generally, residential
12 customers tend to export a higher percentage than
13 commercial customers. That's in part because commercial
14 customers tend to peak in the middle of the afternoon
15 when solar output is relatively high.

16 Also, generally, residential customers tend to
17 install larger systems compared to their usage than
18 commercial so that the size of the system relative to
19 the load also is a key variable in how much is exported.

20 Q. Would you agree that generally, at least in the
21 summer, the residentials consume more than they export?

22 A. In Arizona, I would -- I would tend to agree
23 with that, yes.

24 Q. So there is some value in considering both the
25 output and the exports, correct?

1 A. Yes.

2 Q. Okay. Another area I would like to talk to you
3 about is the appropriate testing to be used in
4 determining the value of solar.

5 On page 20 of your rebuttal, Mr. Beach, you talk
6 about both participant and RIM tests, correct?

7 A. Yes.

8 Q. Do you think RIM test is appropriate, an
9 appropriate test to use in the consideration of the
10 value of solar?

11 A. Yes. Along with the other tests. I would not
12 look at it exclusively.

13 Q. Okay. So the other test would be the
14 participant cost test, correct?

15 A. Yes, that's one of the other ones, yes.

16 Q. And I notice that you talk about it quite a bit.
17 How does that work, that test, sir?

18 A. For the participant test, on the cost side of
19 the test is the cost of the DG system itself plus
20 integration costs, plus -- well, actually, the principal
21 test for the participants is the cost of the DG system
22 itself. And then the benefits for the participant test
23 are the bill savings for the customer from reducing
24 their utility bill.

25 Q. How would we know what the cost of the system

1 is?

2 A. There are, you know, there are industry surveys
3 out there. I used a survey that Lawrence Berkeley
4 National Lab conducts every, I believe it's every year,
5 of installed solar prices throughout the U.S.

6 Q. Do you use a lease rate as a system cost?

7 A. For this, for my study here, I used the
8 customer-owned cost. The costs that were estimated for
9 lease systems were very similar.

10 Q. Are these system costs what the solar companies
11 report to investors as system price, or are they what
12 they report to the IRS for system price?

13 A. They're costs that LBL accumulates from a
14 variety of sources. You know, there are some states
15 that, you know, where they have -- that have databases
16 of solar installations, including the costs. And so
17 installers report those costs when they apply. So, you
18 know, that's the kind of information that I think that
19 LBL draws on for their surveys. The report is called
20 Tracking the Sun, and it's widely available if you want
21 to look at the details.

22 Q. Are there transmission and distribution savings
23 in solar?

24 A. I believe there are, yes.

25 Q. Have you identified the transmission lines that

1 will be avoided if we do DG in Arizona?

2 A. Again, it's -- my view is that it's not a matter
3 of going out and DG avoiding a specific transmission
4 line. The avoided T&D costs arise because DG will
5 reduce the loading on the T&D system. They'll reduce
6 the peak demand on the system, and the peak demand is
7 correlated with how much the utility has to invest. We
8 do a long-term regression of peak demand versus T&D
9 investments, and it gives you the marginal T&D costs.

10 So it would be an impossible task to try to
11 identify individual projects that are being deferred
12 because there are many things that reduce the utility's
13 peak demand, not just DG. Energy efficiency, demand
14 response, changes in the economy, et cetera. So, you
15 know, what you need to do is calculate their marginal
16 T&D costs, and associate that with a change in peak
17 demand as a result of DG.

18 Q. So there's really no way to verify a documented
19 transmission line being avoided because of DG; is that
20 fair?

21 A. Yeah, occasionally you -- like the report from
22 California that I think has been introduced in this case
23 where the utility will come out and say, yeah, we're not
24 doing these lines because of energy efficiency and
25 rooftop solar. But that's not going to be the norm.

1 Q. But aren't transmission and distribution
2 upgrades location-specific?

3 A. To some extent, yes.

4 Q. So in order to get the benefit of avoiding them,
5 doesn't the PV have to be location-specific?

6 A. Especially with respect to distribution, yes.
7 But if you assume that, you know, that DG is being
8 installed across a utility service territory, some of it
9 will be installed in areas where the utility really
10 needs distribution capacity, and that will have an
11 immediate savings above average.

12 And other DG may be installed in areas that have
13 excess capacity and may not produce savings for a number
14 of years. But on average, there will be, you know, a
15 cost savings. It will be greater in some areas and less
16 in others.

17 Q. So is there any way that we can be sure that PV
18 systems are specific to a location to avoid a
19 transmission or a distribution line in that location?

20 A. Well, that's kind of the cutting edge of DG.
21 California and New York are working on programs to do
22 exactly that, to try to get DG sited in areas where the
23 need is most immediate. But -- and I think that perhaps
24 some of the things that APS is doing in Arizona will
25 help, you know, indicate how DG combined with smart

1 inverters and storage can be targeted to areas where
2 they're most needed.

3 Q. So in the meantime, how do we place a value on
4 this in our consideration of the value of solar?

5 A. I think in the short-run you have to do what I
6 did in my benefit/cost study which is look at the
7 correlation between T&D investments and peak demand.
8 And that is, you know, that's kind of an average to
9 top-down type approach; but it's one that utilities
10 often use to calculate their marginal T&D costs. And it
11 gives you a, you know, a general relationship between
12 changes in peak demand and changes in T&D costs.

13 Q. Mr. Beach, in the world of electricity, can you
14 tell me somewhere else where ratepayers actually pay
15 value?

16 A. I'm not sure what you mean by value.

17 Q. Well, the actual value that we're trying to
18 attribute that the solar utility -- excuse me, the solar
19 industry is claiming, the actual value because of all
20 the benefits versus the costs. Is there any other area
21 in electricity where ratepayers actually pay --

22 A. Sure. You know, qualifying facilities under
23 PURPA are paid avoided cost prices, and I think you
24 would describe -- that's similar to what we do, we're
25 trying to do here. That represents the costs that are

1 avoided by these resources being in place; and because
2 those resources are in place, you don't have to do
3 something else, and that's -- ratepayers certainly pay
4 for those costs.

5 Q. Can value be subjective?

6 A. Well, you know, there's -- as you get into more
7 and more benefits that are more difficult to quantify,
8 you know, it becomes more subjective. But I think that
9 for most of the categories of costs here, there are
10 pretty well defined ways to estimate them.

11 Q. If solar continues to decline in price, and
12 let's say it costs 3 cents per kilowatt but the value is
13 10 cents per kilowatt, should ratepayers pay the 10
14 cents per kilowatt?

15 A. I don't -- what kind of solar are you talking
16 about?

17 Q. DG.

18 A. DG. I mean, if solar costs, DG solar costs only
19 3 cents a kilowatt hour, then I would agree that, you
20 know, if the rate is 12 cents, then net metering, you
21 know, would be out of balance. You would be -- the
22 costs would be 3 cents and the bill savings and lost
23 revenues would be 12 cents. And so from the participant
24 test, the participant would be getting a great deal and
25 the nonparticipating customer would not be getting a

1 great deal. And so that's certainly a situation in
2 which there would need to be something besides net
3 metering.

4 Q. You would agree that we must, regardless what
5 the numbers come out, we must have a common sense
6 approach to this, correct?

7 A. It's always a good idea.

8 Q. If the ratepayer can get community solar in the
9 distribution system, let's say for 6 cents per kilowatt,
10 should the ratepayer pay 12 cents for residential
11 rooftop PV?

12 A. Is your hypothetical that the cost of the
13 community solar facility itself is 6 cents?

14 Q. Yes.

15 A. Yeah, the thing about that is that that power
16 still needs to be moved over the utility's T&D system to
17 get to the community solar subscribers, and --

18 Q. Let me -- I'm sorry, go ahead. I don't want to
19 cut you off.

20 A. I doubt the utility would agree to move that
21 power, to wheel that power over its system for free. So
22 my guess would be that you would have 6-cent community
23 solar and the utility charge 6 cents for T&D, and the
24 end cost to the community solar would be 12 cents, just
25 like the DG.

1 Q. Okay. But let's say the end cost was 6 cents or
2 8 cents, for that matter. Should the ratepayer pay 12
3 cents, hypothetically, if that's what our residential
4 rooftop PV is, should the ratepayer pay that?

5 A. So your hypothetical is that community solar
6 costs are less than the full retail rate?

7 Q. Yes.

8 A. Well, you know, I am not aware of anywhere where
9 that has turned out to be the case. The community solar
10 projects that I'm aware of, they're not -- there are
11 situations where the cost to the customer is usually at
12 or somewhat above the retail rate. If you could
13 actually have a utility who would agree to a community
14 solar arrangement that actually saves customers 4 cents
15 a kilowatt hour rather than charging them a premium, you
16 know, first of all, I think that would be pretty heavily
17 subscribed by customers. And whether it would be a
18 benchmark for net metering, you know, if you actually
19 could have that arrangement in place, my guess is that
20 the cost of DG solar would be less than 12 cents.

21 Q. Do you agree that it should be less than 12
22 cents if that were the arrangement?

23 A. You know, I think I'd need to know what the cost
24 difference is between DG solar and community solar.
25 Your hypothetical seems to posit a really big difference

1 between those two kinds of projects, which I'm not sure
2 that that would be the case.

3 Q. Okay. So it's your testimony that the size of
4 the difference is important or necessary in order for
5 you to opine on that, right?

6 A. Probably, yes.

7 MR. POZEFSKY: Okay. I think that's all I have.
8 Thank you, Your Honor.

9 Thank you, Mr. Beach.

10 ACALJ JIBILIAN: Ms. Scott?

11

12 CROSS-EXAMINATION

13 BY MS. SCOTT:

14 Q. Good afternoon, Mr. Beach.

15 A. Good afternoon.

16 Q. So I wanted to ask you with respect to the cost
17 of service studies. APS filed its cost of service study
18 in this docket, and I believe TEP and UNSE indicated
19 that theirs were in their rate case, but that's what
20 they would recommend.

21 But your position is that those cost of service
22 studies are not appropriate to determine cost shifts?

23 A. Yes.

24 Q. And can you tell me why?

25 A. Well, I think that the -- generally cost of

1 service studies just focus on an historical test year.
2 They just look at one year of the utility's costs;
3 whereas, what we're talking about here are long-term
4 generating resources that will be around for 20 years.
5 And you don't capture all of the benefits of these
6 resources by just looking at a single test year. I
7 think that's probably the most important reason.

8 The second reason is that cost of service
9 studies use embedded costs. They don't use marginal
10 costs. Marginal cost is the change in costs, you know,
11 with a change in demand. I think you really need to
12 look at marginal costs to assess the benefits of DG.

13 Q. You mentioned earlier that, I think it was
14 California has a full decoupling, full revenue
15 decoupling in place, correct?

16 A. Yes.

17 Q. How do they determine the cost shift in that
18 state?

19 A. They have done a series of long-term benefit/
20 cost studies of net metering. The first one was done in
21 2010. Then they did another one in 2013, and then most
22 recently, they developed this public tool model which
23 was used by the parties in the net metering 2.0
24 proceeding in California. So every few years they've
25 done a long-term benefit/cost study such as what I've

1 recommended to look at the cost shifts associated with
2 net metering.

3 Q. So they don't look at decoupling in terms -- in
4 the context of a rate case?

5 A. No. You know, I have to say rates have been
6 decoupled in California for about 30 years. So they
7 just don't -- they don't look at decoupling issues in
8 California at all. It's just the way it's done.

9 Q. So that situation is much different than what
10 we're looking at here then, correct?

11 A. Well, yeah. In Arizona you have the potential
12 for DG that's installed between rate bases -- excuse me,
13 installed between rate cases to affect the utility's
14 earnings, so you have things like the LFCR process which
15 is kind of a partial decoupling to address that issue.

16 Q. I just want to ask one more follow-up question
17 on this.

18 Given the situation in Arizona where we do look
19 at it within the confines of a rate case, don't you
20 believe that the cost of service test would be an
21 appropriate means to determine the cost shift?

22 A. Not for a long-term resource, because you just
23 can't capture all the benefits and costs by looking at
24 one year of costs and savings. Many of the savings that
25 these technologies are going to produce may not

1 materialize, especially if it's an historic test year
2 that has already happened. You're just not going to
3 capture them.

4 Q. Okay. So your recommendation would be to look
5 at avoided costs, as many parties are, most parties are
6 in agreement on that, to look at the avoided costs, I
7 guess as set forth in the PURPA model; is that correct?

8 A. Yes, it's basically following the model that was
9 first kind of pioneered by PURPA but then has been
10 extended to be used, you know, for other demand-side
11 resources for energy efficiency and demand response.

12 Q. Do you know if under PURPA there is a
13 requirement that short-term avoided costs be used in
14 that computation?

15 A. It doesn't have to be short-run avoided costs,
16 is my understanding.

17 Q. Okay. And your recommendation would be to use
18 long-term avoided costs, correct?

19 A. Yes.

20 Q. And under that scenario, you're advocating that
21 the Commission look at the useful life of a solar DG
22 system, correct?

23 A. Yes.

24 Q. And you have a wide range there, however. You
25 have from 20 to 30 years. I've seen 20 years, but I

1 haven't seen the 30 years before. Is there a reason why
2 you've got such a wide range there?

3 A. Well, most of the studies that we've done have
4 been 20 years. However, I just did testimony in an IRP
5 proceeding in Georgia where they did 30 years, because
6 the utility did all of its IRP costs on a 30-year basis.
7 So that's what I used. But I generally would support 20
8 years.

9 Q. Well, I want to just follow up on the last
10 answer that you gave.

11 Would your recommendation then be to use the
12 time span used in the IRP process in looking at
13 long-term costs?

14 A. My recommendation is to use the life of the DG
15 facility, which could be -- you know, some states have
16 like 10-year IRP forecasts. I think that's too short.
17 I think you need to look at it for more than 10 years.
18 I would recommend 20 years as a minimum.

19 Q. Do you know what the IRP looks at in Arizona?

20 A. I think it's -- my recollection is 15 years or
21 something on that order.

22 Q. Okay. I think that's correct.

23 But the 15 years might be an alternative, in
24 your opinion?

25 A. You know, I would prefer 20. Maybe if we were

1 negotiating a comprehensive settlement or something,
2 but, you know, I have a 13-year-old solar system on my
3 house that is running beautifully, and I'm sure it's
4 going to last at least 20 years. So these technologies
5 are warrantied for 20 to 25 years. So that's what I
6 would prefer, the term that I would prefer.

7 Q. So somewhere in your testimony you state that in
8 Arizona the right balance exists now, correct?

9 A. Yes.

10 Q. And so by that, I assume you mean that a retail
11 rate should remain in effect for exports?

12 A. Yes.

13 Q. And that the two-part rate should be maintained?

14 A. Yes.

15 Q. If there were changes made by the Commission as
16 a result of this proceeding, and by that I mean if
17 there's a methodology adopted and it would lead to a
18 different result, would you support that result?

19 A. You know, I guess I would have to see what the
20 results of that are. I mean, you know, I can tell you
21 that I -- you know, the Commission in Nevada chose a
22 different methodology from what we recommended, and I
23 don't support that outcome. I mean it has pretty much
24 decimated the industry there, and the Commission did not
25 look at the impact of their decision on participating

1 solar customers. And that's what happened.

2 Q. Now, they had a subsequent decision, did they
3 not, which spread the impact over 12 years?

4 A. Yes, that's correct. And, you know, I know that
5 there are, there are still active discussions on that
6 issue going on in Nevada.

7 Q. I wanted to talk to you a little bit about your
8 comparisons between grid scale and rooftop solar.

9 I understand your characterization when you say
10 that it's not quite an apples-to-apples comparison. And
11 you suggest in your testimony that in order to get an
12 apples-to-apples comparison, I believe, that you would
13 add in, that you would need to add in the long-run
14 marginal costs associated with this at both transmission
15 and distribution?

16 A. Yes.

17 Q. And have you done that calculation?

18 A. I don't -- no, not explicitly.

19 Q. Is that a difficult calculation to do?

20 A. You know, I have done it in other contexts, so
21 no, it's not particularly difficult. It takes a little
22 bit of effort, but it's not particularly difficult.

23 Q. I wanted to ask you, you talk about a lot of
24 different states in your testimony, but I didn't see any
25 reference at all to Utah. Are you familiar with what

1 the Utah Commission did?

2 A. I have not -- only very generally. I have not
3 been involved in DG issues in Utah.

4 Q. With respect to the general information you
5 have, what is your impression of that state's most
6 recent order?

7 A. Well, my understanding of it was they have a
8 methodology that has cost of service studies with and
9 without DG, and then I also understood that they were
10 also looking at long-run avoided costs for long-run
11 benefits. But it sounds like kind of an effort to make
12 everybody happy. But I am not aware of the results of
13 whether they've done their study or what the results
14 are.

15 Q. I think that would be a great result to make
16 everyone happy.

17 I wanted to ask you, you've set out four
18 different tests in your testimony; is that correct?

19 A. Yes.

20 Q. You've got the RIM test, you've got the
21 participant test, the societal test, and then, let's see
22 here, the TRC?

23 A. Yes.

24 Q. Could you just explain each of those for us very
25 quickly?

1 A. Sure. And there is a, if you want, it's kind of
2 a guide to the tests. Table 1 in my direct testimony
3 shows which costs and which benefits are included in
4 each of the tests.

5 So the participant test looks at the perspective
6 of the DG customer, and in that test, the costs are the
7 costs of installing DG on the customer's premises. The
8 benefits for the customer are federal tax benefits and
9 the bill savings that they get from reducing their
10 utility bill. So that's the participant test.

11 The RIM test -- RIM stands for Ratepayer Impact
12 Measure, and that looks at the perspective of
13 nonparticipating ratepayers. So in that test, the costs
14 are the utility's lost revenues, which are equal -- the
15 same thing as the bill savings. So what is a cost in
16 the RIM test is a benefit in the participant test. And
17 then in the RIM test the benefits are the utility's
18 avoided costs. So the nonparticipating customers have
19 to pay the credits given to participating customers, but
20 the benefit they get is over time. The utility lowers
21 its costs. They use less fuel. They build fewer power
22 plants. They put in less T&D infrastructure. You can
23 also include as a cost in the RIM test integration costs
24 and program administration costs.

25 And then the total resource cost test, that

1 looks at, you know, is this a cost-effective resource to
2 the system as a whole? In that test, the costs are the
3 capital and O&M costs of the DG, how much does it cost
4 society to build DG. And the benefits are the benefits,
5 the avoided cost benefits to the utility from the
6 utility not having to build that resource. And again,
7 on the cost side, you can include the program
8 administration and integration costs on that test.

9 Now, the societal test is just a variation of
10 the TRC test where you include societal benefits as
11 well.

12 Q. Okay. Thank you for that.

13 So you're advocating that the Commission look at
14 all of these tests?

15 A. Yes, and I think that it's important to have all
16 three of those perspectives, especially to balance the
17 first two, the perspective of the participants and the
18 nonparticipants.

19 Q. Okay. And I wanted to ask you, do all the other
20 states use these tests?

21 A. I think states differ in the weight that they
22 give to the various tests. I think most demand-side
23 programs, most states do look at -- they tend to look
24 at, especially look at the TRC and the RIM tests, and
25 then you have to look at the participant test to make

1 sure it's a good deal, that you're going to get people
2 to sign up for your program. So I think most states
3 look at all three of these tests. Some of them put
4 different weights on -- some of them weight the TRC test
5 more and the RIM test less. Others rate the RIM test
6 more and the TRC test less. That's kind of a state by
7 state.

8 Q. Are there any states in looking at the value of
9 distributed generation that don't utilize these tests?

10 A. Well, you know, it's somewhat amazing to realize
11 this, but Hawaii, which has, of course, the highest
12 penetration by far, they have not really looked at --
13 they haven't really looked at the benefits and costs
14 yet, despite their penetration. I think they are going
15 to in the next phase of their DG rulemaking, but that's
16 a state that hasn't looked at it from this framework.
17 But lots of states have.

18 Q. Most do then?

19 A. Yes.

20 Q. Okay. You had a discussion earlier that value
21 of solar studies are not used to set rates, correct?

22 A. Yes.

23 Q. And I want to ask you about that because you
24 quote from Mr. Albert's testimony in your rebuttal. And
25 you quote him as saying, for example, the Commission can

1 consider the VOS in determining the amount paid to
2 customers who export energy to the grid from their
3 rooftop solar system. Isn't that setting a rate?

4 A. I'm sorry, where are you referring to?

5 Q. Look at page 4 on your rebuttal, in your
6 rebuttal. Lines 7 through 13.

7 A. Well, that's Mr. Albert's testimony. It's not
8 mine.

9 Q. Okay. And I wanted to ask you about the
10 Minnesota value of solar tariff.

11 Does that tariff contain rates?

12 A. Yes, that is -- my understanding of the
13 Minnesota value of solar tariff is it would be a
14 buy-all/sell-all rate, so you would receive the value of
15 solar for all of your output. It's also my
16 understanding that none of the utilities in Minnesota
17 have yet adopted that, so it's not actually in effect.

18 Q. Okay. And then, what were the results of your
19 avoided cost calculations?

20 A. I think if you look at my study and you look at
21 table 1 where it says direct benefits, and then it has
22 south-facing, west-facing and average, those would be
23 the avoided cost benefits. So 18.7 cents for
24 residential and 20.7 for commercial.

25 Q. And that's under a long-term analysis, correct?

1 A. Yes. Those are 20-year levelized numbers.

2 Q. 20 years. In response to Commissioner Little's
3 questions, you talk about smart inverters and storage,
4 and you talk about the benefits associated with those.

5 A. Yes.

6 Q. How would you factor in those benefits into an
7 avoided cost determination?

8 A. Smart inverters have the potential to enable
9 solar to provide additional benefits on the distribution
10 system such as voltage support and perhaps even some
11 measure of dispatchability. Storage can be a major game
12 changer in terms of the value of solar because it can
13 enable the maximum output of solar to be -- you can
14 actually shift the output profile of solar to the exact
15 period when you want it using storage, by using solar to
16 fill the storage and then having the storage discharge
17 at the period that's most valuable to the utility.

18 So, whereas solar alone may have a capacity
19 value that's only, you know, 30 to 50 percent of its
20 nameplate, if you combine solar with a relatively small
21 amount of storage, you can dramatically increase the
22 capacity value of solar to, you know, potentially to its
23 full nameplate.

24 Q. Okay. So it sounds to me like if these
25 technologies start becoming more commonplace and

1 incorporated into the network here, that that will
2 automatically, in your opinion, be taken into account in
3 the avoided cost determination as it's now set out; is
4 that correct?

5 A. Yes. It would be -- as technologies develop,
6 such as storage and smart inverters, then those benefits
7 could be incorporated into this methodology.

8 Q. And I just want to follow up, too. You had made
9 the statement, I believe Mr. Loquvam asked you about the
10 use of long-term forecasts to set rates, and you're
11 saying you're not setting rates here. Could you
12 elaborate on that?

13 A. Well, again, we're not setting rates. We're
14 just looking at the long-term benefits and costs of
15 these technologies, and, you know, net metering and rate
16 design affect the balance of benefits and costs.

17 Q. Okay.

18 A. And so if you think that the balance is not in
19 the right place and it needs to be adjusted, then one
20 way to do that is to, is through rate design. I'm
21 not -- this is not like setting utility rates where you
22 have to set rates to exactly cover the cost. What we're
23 trying to do here is achieve a balance of benefits and
24 costs in the eyes of the regulator, between those who
25 install DG and remaining ratepayers. And one way to

1 adjust that balance is through rate design.

2 Q. Okay. So the avoided cost determinations that
3 you referred to earlier, the 18.7 and the 20.7 for
4 commercial, 18.7 for residential, you're not
5 recommending that the Commission adopt those for the
6 export rate, but just consider that along with all the
7 other factors, correct?

8 A. That's correct.

9 Q. Okay.

10 MS. SCOTT: Your Honor, I'm just going to page
11 through here to see what else I have left.

12 BY MS. SCOTT:

13 Q. On page 6 of your rebuttal testimony --

14 A. Okay.

15 Q. -- I thought it was amazing that you and
16 Mr. Brown agreed on something. You state, "I agree with
17 Mr. Brown that it is preferable to use markets and
18 market prices to establish the benefits of DG."

19 I found your discussion then about this point
20 interesting, and that's over on page 7, lines 14 through
21 18. Can you talk a little bit about the challenges in
22 Arizona with respect to that.

23 A. Yes. You know, utilities in the U.S. are
24 organized and regulated in different ways. And energy
25 markets in the U.S. are organized and regulated in

1 different ways. There are some regions in the country
2 that have, that have kind of deregulated wholesale
3 markets that have ISOs who run transmission grid, that
4 have day-ahead energy markets. And in those markets, a
5 lot of data is available on hourly energy prices. Data
6 is available on transmission congestion. Data is
7 available in some of them on capacity prices. Some of
8 them have capacity markets that have visible transparent
9 prices. And that kind of information is of significant
10 assistance in doing these studies.

11 So, you know, we've done studies in California
12 which has, you know, a day-ahead market but it does not
13 have a capacity market. We've done studies in New
14 England that has both capacity markets and day-ahead
15 energy markets. We've done studies in PJM that probably
16 is the most sophisticated of all of them. And the more
17 deregulated markets have more data available, so it
18 tends to make the studies a little easier to do,
19 especially on an hourly type basis. But, you know,
20 we've also done them in places like Arizona that still
21 have vertically integrated utilities where it's a little
22 more difficult to get the data. But the same principles
23 and the same avoided costs are being studied in all
24 these, in these different markets. It's just a matter
25 of -- you know, some of them the data is a little more

1 readily available.

2 Q. Okay. I wanted to ask you with respect to the
3 export rate. Let's say that your avoided cost
4 methodology produced an export rate for residential of,
5 oh, let's say 11 cents. Would you advocate that the
6 Commission adopt that export rate?

7 A. Would that be 11 cents, a levelized rate for 20
8 years? Is that the idea? My methodology does produce,
9 you know, a levelized 20-year rate.

10 Q. Okay. Well, yes, let's assume that we've used
11 the long-term avoided cost methodology and that the
12 levelized, it's levelized so it produces an 11-cent
13 rate.

14 A. And is your question whether that would be,
15 result in an equitable balance between like
16 participating and nonparticipating ratepayers?

17 Q. Yes.

18 A. You know, if we felt the methodology was robust
19 and that it was accurately capturing the costs, then,
20 you know, I would recommend to my client that that might
21 be a reasonable rate.

22 Q. Okay. You suggest to the Commission, as do a
23 lot of people, including Staff, that the Commission in
24 this proceeding focus on the export rate, correct?

25 A. Yes, although, you know, again, I think it's a

1 lot easier to calculate the all-output rate. So that
2 issue has to be weighed as well.

3 Q. And in your testimony, I think you do state that
4 there are some benefits related with on-site production.
5 How would you incorporate those into this methodology?

6 A. You said that there are some benefits associated
7 with on-site production?

8 Q. I thought that was your testimony.

9 A. Well, most of the benefits of the power being
10 used on-site are also realized by, even with the power
11 that's exported, because it's literally used by the
12 neighbors. So there isn't a huge difference between the
13 benefits for whether the power is being used by yourself
14 or by your neighbors.

15 Q. And then you also talk about incentives, the use
16 of upfront incentives. And one of the uses you suggest
17 is to encourage and incentivize west-facing systems,
18 correct?

19 A. Yes.

20 Q. Are you also proposing incentives for any other
21 similar type of --

22 A. Well, I think I -- I believe I mentioned in my
23 rebuttal incentives for storage that, you know, for
24 example, some states are incentivizing distributed
25 storage as a way to -- in the same way that utilities in

1 many states incentivized solar, you know, a few years
2 ago to get it off the ground. States are incentivizing
3 storage in order to start to bring that technology to
4 scale, because it potentially has, you know, enormous
5 benefits, including used at the distributed level.

6 So I would certainly think it would be very
7 positive if Arizona helped in that effort and
8 incentivized storage.

9 Q. And I think -- have you read Mr. Solganick's
10 testimony?

11 A. I know I read his direct testimony. I'm not
12 sure I read his rebuttal.

13 Q. I think it was in his direct, he suggested
14 perhaps using incentives to get DG rooftop sited in a
15 particular area where it may have benefits for the
16 distribution feeder.

17 Do you recall that?

18 A. Yes, and I would agree that that would be a good
19 idea. I would support that.

20 Q. Now, in your opinion then -- because you use
21 this balancing test, also. In your opinion, then, would
22 you factor all of these incentives into the equation in
23 determining the right mix?

24 A. Well, I think, you know, for example, my study
25 calculates a higher value for west-facing systems, of,

1 you know, several cents a kilowatt hour. So you could
2 look at that difference in the value, and you could use
3 a portion of that difference in value to construct an
4 incentive for people to site their solar facing west.

5 Q. But I think my point was, you talk a lot about
6 the rate design. You talk about incentives. You talk
7 about the export rate, the avoided cost, and I read your
8 testimony to say that you can adjust these in different
9 ways, and you can create the right balance. You don't
10 have -- it's not one correct answer; is that correct?

11 A. That's correct. And I think I've kind of
12 emphasized in my testimony today that one way to adjust
13 the balance is through rate design. But you also can
14 adjust the balance through various kinds of incentives.
15 And if you look at the study that we did in 2013 in
16 Arizona, back in that time frame, there still were some
17 incentives for solar, and those were factored into that
18 study as a cost because those are a cost to ratepayers
19 for paying those incentives. So if there would be an
20 incentive for, you know, west-facing systems, then that
21 should be kind of included in the calculation as a cost.

22 Q. I think that might be all I have. That is all I
23 have. Thank you, Mr. Beach.

24 A. Thank you very much.

25 ACALJ JIBILIAN: Mr. Rich, do you have redirect?

1 MR. RICH: Your Honor, just a couple questions
2 real quick. And then we'll get you out of here,
3 Mr. Beach.

4

5

REDIRECT EXAMINATION

6 BY MR. RICH:

7 Q. You were just asked about, a hypothetical
8 finding that if your methodology was run and an 11-cent
9 output were to come out of it, and in that hypothetical
10 I think it's presumed that 11 cents is just below the
11 retail rate. The question was, would you support the
12 Commission adopting that rate?

13 Would you agree that if the Commission should
14 find 11 cents or some other number below retail comes
15 out of that methodology, would you agree that it has
16 options besides adjusting the net metering rate, and
17 that it could look at rate design if it wanted to
18 preserve the simplicity of net metering but deal with
19 some shortfall?

20 A. Yes. I think that's an important consideration,
21 because, you know, the real value of net metering and
22 why it's been such a successful policy is the customers
23 understand it, and they understand that, you know, they
24 pay the retail rate when the meter runs forward, and
25 they get credited the retail rate when the meter runs

1 backwards. And so, you know, I think that the
2 Commission probably should look first at the kind of
3 changes I've recommended to rate design before it takes
4 the next step to create a completely separate export
5 rate so that customers then are being compensated
6 differently for imports versus being credited for
7 exports.

8 Q. Okay. Thank you. And I wanted to clear up much
9 earlier today, at this point, you were asked about the
10 Nevada, I think it was APS Exhibit 11 which was an order
11 out of Nevada that was from sometime in mid February.

12 Do you recall that line of questioning?

13 A. Yes.

14 Q. And I just wanted to clarify, that was an order,
15 APS Exhibit 11 is an order that dealt with a discrete
16 issue within the Nevada discussion, correct? It was
17 with regard to the grandfathering issue only?

18 A. Yes. The original order on the rates and net
19 metering came out, I believe, on December 23 of 2015.

20 Q. Okay. So when you were examining the job losses
21 that you referred to, you were not looking at the job
22 losses in the few days between that February order and
23 your February testimony in this case, but instead you
24 were looking at the job losses that flowed from the
25 December decision, correct?

1 A. Yes. Those were job losses that -- I filed that
2 subsequent testimony, I think, on February 5th or 1st.
3 Actually, I filed direct on the 1st and rebuttal on the
4 5th. And so the job losses were what had been
5 documented basically during the month of -- the end of
6 December and during January.

7 Q. Just to clarify, there has been a lot of talk of
8 forecasting, but you would agree that the utilities
9 before they decide to acquire a resource or construct a
10 gas-fired power plant, for example, use forecasting to
11 make that decision, correct?

12 A. Yes.

13 Q. Okay. And those forecasts are made, yet future
14 occurrences, either slower growth of the service
15 territory, negative growth in the service territory,
16 price of gas and other issues can impact the reliability
17 of those forecasts?

18 A. Yes. And so, you know, the conditions under
19 which those decisions to build that plant were made can
20 change in the future. And sometimes that's a benefit to
21 ratepayers. Sometimes it's a cost.

22 Q. And just one final clarifying question.

23 Would you agree that there's nothing unique
24 about the way that utilities treat reduced kilowatt hour
25 sales arising from the use of distributed generation

1 versus the way that they treat reduced kilowatt hour
2 sales arising from any number of energy efficiency
3 devices or strategies or just a customer who is more
4 careful in using their energy or otherwise reduces their
5 energy consumption?

6 A. No, there's really no difference. You know, I
7 know that in Arizona, the LFCR mechanism deals with both
8 DG and -- loss in sales due to both energy efficiency
9 and demand response as well as DG. And I think those
10 sales reductions are basically treated the same in that
11 process.

12 Q. Okay. I have no other questions. Thank you
13 very much.

14 ACALJ JIBILIAN: Is there any recross based on
15 that redirect?

16 MR. LOQUVAM: Yes, Your Honor.

17 ACALJ JIBILIAN: Mr. Loquvam.

18

19 RECROSS-EXAMINATION

20 BY MR. LOQUVAM:

21 Q. Mr. Rich just discussed the retail rate credit
22 and the 11-cent issue. And we've all banged our heads
23 at one point or another individually and collectively
24 about possibilities for middle ground.

25 Would you support or recommend to your client or

1 do you think TASC would support, if you know, a retail
2 rate credit that is not net metering but equaled the
3 retail rate? So if, for instance, APS's average retail
4 rate is about 12 and a half cents per kWh. So instead
5 of a 1 for 1 kWh, it's just a 12.5-cent credit on the
6 bill and the customers see the exact same monetary
7 impact.

8 A. I'm not sure I understand how that's different
9 than net metering.

10 Q. It's just not net metering, but it's just the
11 full retail rate. Or maybe a 12-cent or a slight
12 reduction. I mean, is there any wiggle room? At what
13 point do we start moving to the middle?

14 A. I would have to understand how that's different
15 than net metering. I mean, if you're getting, if you
16 get a 12-cent credit under net metering and you would
17 get a 12-cent credit under your approach that's not
18 called net metering, how are they different?

19 Q. So, in other words, you would support it or
20 think --

21 A. I mean, you know, at the end of the day, I
22 believe that what the solar industry wants to do is have
23 a reasonable chance to grow, you know, and to market its
24 product; and net metering has been very successful, as I
25 said, because the customers understand it and it's

1 simple. But it is, you know, it is a rough justice kind
2 of approach, and you have to do studies like this in
3 order to make sure that it still is the right approach.

4 Q. Then on the second point in discussing forecast
5 change, wouldn't it be better for customers and protect
6 nonDG customers more if whatever export rate is
7 established was trued-up or recalculated annually based
8 on the new forecast?

9 MR. RICH: Your Honor, I'm going to object. I
10 think this goes beyond the scope of the redirect.

11 MR. LOQUVAM: Your Honor, he's talking about
12 forecast changing, and I'm trying to find solutions.

13 ACALJ JIBILIAN: Can you repeat the question,
14 please?

15 MR. LOQUVAM: I'm happy to.

16 ACALJ JIBILIAN: Yeah, please do.

17 BY MR. LOQUVAM:

18 Q. I mean, it's a question about whether in light
19 of forecasts changing it would make sense to instead
20 have true-ups every year or recalculate forecasts every
21 year as circumstances change.

22 ACALJ JIBILIAN: I'll allow that.

23 THE WITNESS: You know, generally, I think that,
24 you know, this is a -- this certainly is a dynamic
25 market, and there are changes in solar costs; there are

1 changes in utility rates; there are changes in avoided
2 costs. And so, you know, this balance between
3 participating and nonparticipating ratepayers will
4 change over time, and so I do agree that it needs to be
5 looked at periodically. I'm not sure I would do it
6 every year, but every rate case, something like that.

7 MR. LOQUVAM: Nothing further, Your Honor.

8 ACALJ JIBILIAN: Is there anything further,
9 Mr. Rich?

10 MR. RICH: No, thank you, Your Honor.

11 ACALJ JIBILIAN: Thank you for your testimony,
12 sir. You're excused.

13 You can just leave everything there.

14 THE WITNESS: Okay.

15 ACALJ JIBILIAN: Are you ready to call your next
16 witness, Mr. Rich?

17 MR. RICH: Yes, Your Honor. TASC calls
18 Mr. William A. Monsen to the stand.

19

20 WILLIAM A. MONSEN,
21 called as a witness on behalf of TASC, having been first
22 duly sworn by the Certified Reporter to speak the truth
23 and nothing but the truth, was examined and testified as
24 follows:

25

1 DIRECT EXAMINATION

2 BY MR. RICH:

3 Q. Good afternoon, Mr. Monsen. Thanks for being
4 here and hanging around.

5 A. Good afternoon.

6 Q. Make sure your mike is on and you get settled
7 there.

8 A. Okay.

9 Q. All right. First of all, can you state your
10 name and your place of employment for the record?

11 A. William A. Monsen. MRW & Associates, LLC.

12 Q. Who are you here to testify on behalf of today?

13 A. I am testifying on behalf of The Alliance for
14 Solar Choice.

15 Q. Great. I've put in front of you two documents
16 labeled TASC Exhibit 29 and TASC Exhibit 30.

17 Would you agree that TASC Exhibit 29 is a copy
18 of your rebuttal testimony submitted in this docket?

19 A. Yes.

20 Q. Let me ask you then, do you also -- can you
21 identify TASC Exhibit 30 as a Notice of Errata that was
22 filed on May 5, including some corrections to your
23 testimony?

24 A. Yes. That's what it is.

25 Q. Okay. With regard to TASC-29, your rebuttal

1 testimony, was that prepared by you or at your
2 direction?

3 A. Yes, it was.

4 Q. If I asked you those same questions that appear
5 in that testimony today, would you answer them the same
6 way here under oath?

7 A. Yes.

8 Q. And I understand in preparing for today that you
9 have a couple of corrections to make to that; is that
10 accurate?

11 A. Yes, I do.

12 Q. Okay. Why don't you take us through those
13 corrections briefly, and then we can discuss the errata
14 filing and go from there.

15 A. Okay. On page 2 -- oh, I'm sorry. Yes. Page
16 2, line 12, it says, "Used in those costs." It should
17 be "Used in the cost." None of these are very big, by
18 the way.

19 Q. I would ask if you, in that exhibit copy, if you
20 can just line through and correct.

21 A. Okay. On page 4, line 1, insert the word "not"
22 between the words "has" and "met".

23 ACALJ JIBILIAN: What is the page and line
24 reference, please?

25 THE WITNESS: Oh, it's -- okay, page 3, line 32.

1 I think somehow mine is mispaginated.

2 Where it says toward the end of the line, "APS
3 has met its burden," it should be, "APS has not met its
4 burden."

5 On page 18 -- I'm sorry, page 18, line 18, after
6 the word "APS's", you should insert the word "method."

7 On page 22, line 1, you should insert the word
8 "not" at the beginning of that line, so it should read
9 now "not be reasonable."

10 On page 25, footnote 44, line 3, insert the word
11 "supplemental" at the beginning of that line. So it
12 should now read "APS supplemental response."

13 And in that same footnote, going to insert after
14 the 1.15, you're going to insert the phrase "and APS
15 response to TASC data request 2.1B."

16 Those are all the changes to Exhibit 29.

17 BY MR. RICH:

18 Q. And then with regard to Exhibit 30 which is the
19 Notice of Errata, including pages inserted and
20 corrections made to exhibits that were corrected -- I'm
21 sorry, to exhibits that were attached to your testimony,
22 was this document prepared at -- I believe you testified
23 to this. Was this document prepared at your direction
24 or by you?

25 A. Yes, it was.

1 Q. And each of these changes that are reflected on
2 the first page of the document entitled Errata
3 Corrections to Direct Testimony of William A. Monsen,
4 each of those are included in the following pages; is
5 that correct?

6 A. Yes.

7 Q. Okay. And it's your testimony that the pages
8 that follow within this Notice of Errata is a complete
9 copy of the exhibits that should be attached to your
10 testimony in the way that you intended them to be
11 presented and adopted as your testimony today?

12 A. Yes.

13 MR. RICH: Okay. And with that, Your Honor, I
14 would move the admission of TASC Exhibit 29 and TASC
15 Exhibit 30.

16 ACALJ JIBILIAN: Is there any objection?

17 TASC-29 and TASC-30 are admitted.

18 (Exhibit TASC-29 and Exhibit TASC-30 were
19 admitted into evidence.)

20 MR. RICH: Thank you, Your Honor.

21 BY MR. RICH:

22 Q. So now we can get down to business, Mr. Monsen.
23 Give us a brief summary of your testimony and
24 respond, please, to anything that you've heard during
25 the course of the hearing that you think is appropriate

1 to respond to.

2 A. Okay. Thank you.

3 My testimony in this proceeding addresses four
4 main questions that I'm going to walk through them in
5 order.

6 The first question is, should the Commission
7 make findings and conclusions in this docket related to
8 the reasonableness of the assumptions or conclusions
9 drawn from the cost of service studies submitted by the
10 utilities? So that's the first question. And my
11 response to that is, while a cost of service study is
12 useful for rate-setting purposes, these models are very
13 complex and very data-intensive, and need very careful
14 scrutiny in order to fully analyze and test the
15 underlying assumptions and modeling.

16 In this proceeding such scrutiny was not
17 possible. Thus, the Commission should not rule on these
18 models or their results in this docket. Why do I
19 believe that this is not the appropriate venue to
20 examine the reasonableness of these very complex and
21 data-intensive models? The main reason, as discussed
22 yesterday by Vote Solar's witness, Briana Kobor, is the
23 model that APS provided to parties in response to
24 discovery was not a "working model," despite the fact
25 that APS labeled the model as such. It is not possible

1 to make changes in other models that APS clearly used to
2 develop inputs for its cost of service model and to see
3 the impact of those changes in its cost of service
4 study.

5 For example, I had originally hoped to analyze
6 the cost of service of solar DG customers using the
7 delivered loads supplied by APS. However, this was not
8 possible, given the lack of functionality in the
9 so-called working cost of service model.

10 Aside from the failure of APS to provide parties
11 with a model with which to analyze alternative
12 assumptions associated with calculation of the cost of
13 service, this docket is a special docket in which it is
14 possible that other parties that are interested in cost
15 of service issues are not actively participating. To
16 adopt decisions regarding the reasonableness of cost of
17 service assumptions and modeling approaches could
18 potentially harm those parties.

19 For those reasons, I recommend that the
20 Commission note potential concerns with the cost of
21 service modeling, but not make findings or conclusions
22 regarding the validity of the modeling submitted in this
23 docket.

24 The second question that I asked is, is the cost
25 of service study -- is a cost of service study even the

1 appropriate tool for the determination of the value of
2 solar? And the short answer is no. A cost of service
3 study is not an appropriate tool for determining the
4 value of long-term resources such as solar DG.

5 Why do I believe this? The most telling reason
6 is that I am unaware of any utility using a cost of
7 service model to determine the reasonableness of
8 decisions regarding the acquisition of long-term
9 resources.

10 I worked for an investor-owned utility for eight
11 years and worked closely with the generation planners in
12 that company. Cost of service models were not used to
13 decide about the reasonableness of resource options.

14 While at the utility, I was involved in
15 consideration and evaluation of demand-side management
16 resources such as energy efficiency and load management
17 programs. We did not use cost of service models to
18 analyze the reasonableness of pursuing those resources
19 either.

20 Since becoming a consultant, I have participated
21 in numerous resource planning dockets, and have never
22 seen a cost of service model used to evaluate resource
23 plans. As a result, it is hard for me to believe or
24 hard for me to understand why APS believes that a cost
25 of service model can provide insights into the

1 reasonableness of long-term resource decisions, which is
2 exactly what solar DG projects are.

3 Why are cost of service models the wrong tool
4 for determining the value of a long-run resource? As
5 Mr. Beach just indicated, they're backwards-looking.
6 They look at the world as it exists in the past at this
7 point in time, not as a utility expects it to be in the
8 future.

9 Second, even if the cost of service model was
10 looking at a prospective test year, it still only looks
11 at a single year. Such an approach might make sense if
12 the future were to look exactly like the present. But
13 as we all know, this is not the case. Loads grow. Fuel
14 prices change. Technology evolves. An IRP addresses
15 these changing relationships. A cost of service model
16 does not.

17 For these reasons I recommend that the
18 Commission give no weight to the cost of service models
19 as tools for determining the value of solar.

20 The third question is, did APS meet its burden
21 of proof regarding its assertions that solar DG
22 customers have load shapes that are so different from
23 other customers that solar DG should be assigned to a
24 new customer class.

25 APS contends that one reason to establish a new

1 customer class for solar DG customers is because they
2 have different load shapes. However, APS has other sets
3 of customers that have different load shapes; but to my
4 knowledge, APS has made no effort to separate those
5 customers into separate customer classes. These include
6 winter visitors and customers that have either smart or
7 setback thermostats.

8 APS tried to claim that winter visitors are very
9 similar to their other customers, and that they in fact
10 pay more than their cost of service. This is not
11 reasonable.

12 I wasn't a witness in the UNS general rate case,
13 but I understand that UNS believes that their winter
14 visitors significantly underpay relative to their cost
15 of service.

16 I'm also aware that other utilities have
17 established special rates for seasonal customers. I'm
18 not trying to pick a fight with winter visitors.
19 However, the fact that winter visitors have loads that
20 peak in the winter, not in the summer. They have very
21 low annual load factors, primarily because they consume
22 very little power in the summer months. Despite having
23 peak loads in the nonsummer months, these customers live
24 in homes and residences just like other customers that
25 live here all year-round, meaning that interconnection

1 facilities for these homes are the same as other types
2 of homes which means that they cost the same to
3 interconnect. All these things tend to point to
4 customers that might pay less than their full cost of
5 service.

6 How did APS reach the conclusion that winter
7 visitors pay more than their full cost of service? APS
8 assumed that the costs allocated to these customers for
9 distribution facilities are based on their loads in the
10 summer months, even though these customers have maximum
11 noncoincident peak demands and some have maximum demands
12 that occur in winter months. Thus, APS's assertion that
13 winter visitors pay more than their full cost of service
14 is incorrect.

15 Another example of a customer group that has
16 very different load shapes than the residential customer
17 class as a whole are customers that somehow reduce their
18 air conditioning usage during the middle of summer days.
19 These customers could be customers that turn up the set
20 point on their thermostats before they leave their house
21 for the day. They could have programmable thermostats
22 that they program to increase the set point during the
23 day. They could even have smart thermostats which could
24 take a signal from the Internet or even from APS to
25 increase the thermostat set point.

1 In any case, when the thermostat set point is
2 increased on a hot day, these customers' air
3 conditioning loads drop until such time as the occupant
4 returns to the home. This results in a dip in usage
5 during the middle of the day which is not consistent
6 with the average load shape of residential customers
7 during those days.

8 I had hoped to obtain information about the load
9 shapes for APS's customers with this and other load
10 control technologies to show the Commission how these
11 APS customers' loads differ from the average. However,
12 APS was unable to provide actual load data for these
13 customers.

14 Thus, I present evidence in my testimony that
15 show how customers' loads change as a result of new
16 behind-the-meter technologies based on studies from
17 other regions.

18 Like with the winter visitors, APS is not
19 proposing to create new customer classes for this group
20 of customers. Based on this selective application of
21 whether customers with different load shapes should be
22 in different customer classes, it appears that APS's
23 proposal to establish new customer classes for solar DG
24 customers is discriminatory.

25 The final question that I asked is, are there

1 assumptions used in the APS cost of service study that
2 are questionable, calling into question the results of
3 the study itself? Even though I believe that this is
4 not the proper venue to vet cost of service models, I
5 felt that it was important for the Commission to see
6 that a number of assumptions used by APS in its modeling
7 were questionable, and when corrected, give
8 significantly different answers regarding the net costs
9 of service for DG customers.

10 First, as pointed out by Vote Solar witness
11 Kobor, APS uses a DG customer's gross load or site load
12 that is the electric used by customers, not the
13 electricity delivered by APS as a billing determinant in
14 its cost of service study. This is different than how
15 APS models other customers such as customers that
16 install energy efficiency, demand response, smart
17 thermostats and other load-modifying technologies.

18 For all of APS's other customers, APS uses the
19 delivered load as the basis for determining cost of
20 service. If APS used the delivered load for solar
21 customers -- I'm sorry, APS did not do this. Realizing
22 that such an approach is unreasonable, APS calculates
23 some value adders to account for the costs that solar DG
24 customers avoid on the APS generation system. However,
25 these value adders only address a portion of the costs

1 that solar DG customers avoid. APS assumes that there
2 are no avoided distribution-related costs resulting from
3 the installation of distributed generation, and it
4 doesn't even try to estimate these values. This is
5 despite evidence from other utilities that energy
6 efficiency and distributed generation have resulted in
7 the ability of utilities to avoid significant
8 transmission-related expenditures. Mr. Beach referred
9 to Pacific Gas & Electric's recognition that they
10 avoided approximately \$200 million of
11 subtransmission-related expenses.

12 Even more troubling, it appears that APS does
13 not assign a generation demand credit to solar DG
14 customers for the energy that these customers inject
15 onto the distribution grid. As a result, APS
16 overestimates the net cost to serve DG customers. This
17 results in an understatement of the value credits for
18 solar DG.

19 Second, even though TASC and others did not have
20 adequate time to vet all of the assumptions used in the
21 APS cost of service modeling, it appears that there are
22 alternative assumptions that are justified for
23 allocation of costs for distribution substation and
24 primary distribution costs.

25 Based on TASC's review of feeder loading, it

1 appears that usage of these facilities is greatest at
2 time-of-peak demand, even though APS uses noncoincident
3 peak to allocate costs. By adopting these assumptions,
4 APS overallocates distribution costs to solar DG
5 customers.

6 To show how alternative assumptions regarding
7 allocation of costs would change the cost of service --
8 the cost of serving solar DG customers, I use an
9 alternative approach to allocating costs based on the
10 work done by TASC witness Mr. Beach in his opening
11 testimony.

12 While TASC is not recommending that the
13 Commission adopt cost of service assumptions in this
14 docket, my testimony shows the types of issues that
15 could be raised if parties had adequate time and access
16 to models to test these cost of service models in a
17 forum where there was adequate time to obtain access to
18 a working cost of service model and to test the modeling
19 assumptions.

20 Based on my conservative assumptions that I use
21 as well as the allocators developed by Mr. Beach, I
22 developed estimates of the percentage of costs covered
23 by solar customers. These are 10 to 16 percentage
24 points higher than estimated by APS.

25 Q. Great. Thank you, Mr. Monsen.

1 MR. RICH: I will tender Mr. Monsen for
2 cross-examination.

3 ACALJ JIBILIAN: Okay. This is a time to take a
4 break. We'll be back in 15 minutes and we can start the
5 cross-examination.

6 (Recessed from 3:13 p.m. to 3:27 p.m.)

7 ACALJ JIBILIAN: Let's go back on the record.

8 Mr. Hogan, does Vote Solar have questions for
9 this witness?

10 MR. HOGAN: No, Your Honor.

11 ACALJ JIBILIAN: Ms. Grabel?

12 MS. GRABEL: Yes, Your Honor.

13

14 CROSS-EXAMINATION

15 BY MS. GRABEL:

16 Q. Good afternoon, Mr. Monsen.

17 A. Good afternoon.

18 Q. I would like to take a look at your resume, if
19 you would. It's attached to your testimony as WAM-1, I
20 believe. You started your career, did you not, at the
21 Madison Solar Energy Laboratory, correct?

22 A. Yes, I was on the academic staff there.

23 Q. It says that you developed simplified methods to
24 analyze efficiency of passive solar energy systems,
25 correct?

1 A. Yes.

2 Q. From there you spent eight years during the '80s
3 at Pacific Gas & Electric Company where it looks like
4 you worked as an economist in the Long-Term Planning
5 Department working with DSM programming; is that
6 correct?

7 A. I worked in various departments at Pacific Gas &
8 Electric. I started in the Energy Conservation and
9 Services Department. I was there for about two years.
10 I was in the Rate Department for about two years. I was
11 in the Economics and Forecasting Department for about
12 two years, and then was in the Corporate Planning
13 Department for about two years.

14 Q. When you were in the Rate Department, what was
15 your role?

16 A. I worked on forecasting impacts of demand-side
17 management resources, and also developing methods to
18 compare demand-side management resources and supply-side
19 resources.

20 Q. At Pacific Gas & Electric, you were never
21 charged with putting together a cost of service study;
22 is that correct?

23 A. That's correct.

24 Q. You were never charged with designing rates for
25 utilities' residential customers; is that correct?

1 A. That's correct.

2 Q. And from Pacific Gas & Electric Company -- by
3 the way, did you describe all of your roles at Pacific
4 Gas & Electric Company?

5 A. Those were the four departments that I worked
6 in. I worked on a lot of different things when I was
7 there.

8 Q. From Pacific Gas & Electric Company, you went to
9 MRW & Associates where you have been since 1989; is that
10 correct?

11 A. Yes.

12 Q. And you indicate on your resume that you are a
13 specialist in electric utility generation planning,
14 resource auctions, demand-side management (DSM) policy,
15 power market simulation, power project evaluation, and
16 evaluation of customer energy cost control options; is
17 that correct?

18 A. That's what my resume says, yes. I've also
19 worked on a lot of other things as well as a consultant.

20 Q. In your 83 items of prepared testimony and
21 exhibits that you have attached to this resume, where
22 does it show your experience with cost of service
23 studies?

24 A. Unfortunately, the names of the testimonies are
25 not all that indicative of the types of issues that I

1 worked on. They're not very descriptive, I guess.
2 However, I've submitted testimony in several rate
3 proceedings before the California Public Utilities
4 Commission, and also before the Colorado Public
5 Utilities Commission, looking at revenue allocation and
6 rate design issues. I also did testimony in Nevada
7 regarding the NV Energy cost of service studies in the
8 proceeding late last year.

9 Q. In any of the engagements that you just
10 mentioned, were you charged with developing a cost of
11 service model yourself?

12 A. No. Typically, the way that we work on rate
13 proceedings is that we receive the models that the
14 utility provides, develops, and then that way everybody
15 starts at the same place. And then that way you end up
16 talking about changes of assumptions to the cost of
17 service models as opposed to arguing about whether my
18 model is correct and your model is incorrect. I've been
19 involved in proceedings where things just completely get
20 bogged down when you've got two competing models.

21 And so that's why in this proceeding, I thought
22 it made sense to try to rely on the cost of service
23 study that, the cost of service model that APS produced,
24 and I was going to take that and use that for my
25 analysis.

1 Q. Can I take it from your testimony that you have
2 never developed a cost of service model?

3 A. No.

4 Q. No, I cannot take that from your testimony, or
5 no, you have never developed a cost of service --

6 A. No, I've never developed my own cost of service
7 model.

8 Q. Thank you. And at MRW, I've noticed you
9 personally worked for Vote Solar before. That's a firm
10 client, correct?

11 A. Yes.

12 Q. TASC is also a firm client, correct?

13 A. Yes.

14 Q. What other solar companies does your firm do
15 work for?

16 A. Well, we've done work for a couple of companies
17 on the wholesale side. So we've done work for NRG.
18 We've done work for Luz. And we've also, on the retail
19 side we've done work for Solar City.

20 Q. Have you done work for any other solar advocacy
21 groups besides Vote Solar and TASC?

22 A. No.

23 Q. I know you previously worked with Ms. Kobor who
24 is Vote Solar's witness in this case, correct?

25 A. Yes.

1 Q. Did you work closely with Ms. Kobor?

2 A. She was a senior associate at MRW.

3 Q. Did she ever work directly for you?

4 A. Yes, she would work with me in proceedings.

5 Q. Did you and Ms. Kobor coordinate your testimony
6 in this proceeding?

7 A. No.

8 Q. Did you discuss your testimony in this
9 proceeding?

10 A. No.

11 Q. Of the 83 items of prepared testimony and expert
12 reports you have attached to your resume, 66 of them are
13 related to proceedings in California; is that correct?

14 A. Subject to check, yes.

15 Q. Would you say the majority of the work that you
16 do at MRW & Associates focuses on California energy
17 policy?

18 A. The majority of the work I do focuses on
19 California energy issues. We do work for, as I
20 indicated, wholesale generators, retail suppliers. We
21 do work for large customers. For example, the city of
22 San Diego was the first client I had when I came to MRW
23 in 1989, and I'm still doing work for them. But the
24 California Commission keeps us very busy.

25 Q. Thank you. I would like you to turn to page 3

1 of your rebuttal testimony. I'm specifically looking at
2 lines 1 through 4. You state, and you've actually said
3 this a couple of times on the stand this afternoon,
4 "This is a proceeding that is primarily concerned with
5 the value and cost of DG. It is not a rate-setting
6 proceeding. Thus, this proceeding is not the
7 appropriate place to consider cost of service issues for
8 specific utilities or to consider new rate proposals."

9 Did I read that correctly?

10 A. Yes.

11 Q. I would like to read to you from the February
12 16, 2016, procedural order entered by Judge Jibilian in
13 this case, which I read to Ms. Kobor yesterday, you
14 might remember. Specifically, beginning on line 14.5,
15 Her Honor wrote, "On October 20, 2015, at its regularly
16 scheduled Open Meeting in the course of considering
17 Docket No. E-01345A-13-0248, the Commission ordered that
18 an evidentiary hearing be held in this generic docket to
19 include, in addition to the value and cost of DG, cost
20 of service issues related to Arizona Public Service
21 Company's provision of service to DG and nonDG
22 customers."

23 Do you continue to assert, in light of the
24 Commission's order, that the proceeding is not the
25 appropriate place to consider APS's cost of service

1 issues?

2 A. I think my recommendation is that this is a
3 proceeding related to the value and the cost of DG, and
4 that, as I indicated on page 3 of my rebuttal testimony,
5 it's not a rate-setting proceeding. It's an expedited
6 proceeding relative to a proceeding where you might
7 normally consider cost of service issues, such as a
8 general rate case.

9 Q. Would you agree that it is appropriate for APS
10 to have submitted its cost of service study in response
11 to the Commission's order?

12 A. I don't disagree that they submitted a cost of
13 service study. I don't think it's inappropriate that
14 they submit a cost of service study. I don't believe
15 that a cost of service study is the appropriate tool for
16 valuing solar.

17 Q. You agree, I believe, that APS uses long-term
18 analyses as part of its resource planning process,
19 correct?

20 A. Yes.

21 Q. That does not mean that APS recovers through
22 current rates the long-term value of any specific
23 resource; is that correct?

24 A. In any particular year, it doesn't. But over
25 time, it would.

1 Q. You believe that APS recovers through current
2 rates the long-term value assessed at any specific time
3 during its integrated resource planning process?

4 A. No. But over time, APS would recover the
5 long-term value associated with those resources in
6 different years; but in a particular year, it doesn't
7 recover the full value of those resources.

8 Q. Mr. Monsen, do you understand that when APS
9 acquires a resource, that investment is put into the
10 company's rate base, and it earns a return based on that
11 plant investment, and it is the investment price of that
12 asset that is depreciated over time, and that's how APS
13 collects its return?

14 A. Yes, I understand that.

15 Q. And you understand that that does not correlate
16 necessarily to any value assigned to it during the IRP
17 process; is that correct?

18 A. That's correct.

19 Q. Is there any reason to distinguish a distributed
20 generation resource from every other resource in the
21 utility's generation portfolio?

22 A. Well, a distributed generation resource is not
23 owned by the utility, and so that's a difference
24 relative to utility-owned assets upon which the utility
25 earns an authorized or has the opportunity to earn an

1 authorized rate of return.

2 Q. Is there any reason to distinguish how a DG
3 resource is compensated from any other resource in a
4 utility's portfolio?

5 A. I don't think I understand your question. Could
6 you repeat it, please?

7 Q. Is there any reason to distinguish how a DG
8 resource owner is compensated compared to how APS would
9 be compensated for the respective resources that they
10 own?

11 A. Well, that happens all the time, I believe, with
12 regard to, say, power purchase agreements that APS
13 enters into. APS doesn't earn a rate of return on those
14 power purchase agreements, which is different than the
15 way it earns a rate of return on its own resources. So
16 it's not surprising that there would be different ways
17 that those resources would be compensated.

18 Q. Your testimony is that distributed generation is
19 a resource for APS; is that correct?

20 A. Yes, it provides energy to APS at the point of
21 interconnection between the customer and the APS
22 distribution system.

23 Q. And your testimony is that because it is a
24 resource for APS, we should assess it the same way that
25 we assess all other of APS's resources in APS's

1 portfolio; is that correct?

2 A. Could you define what you mean by "assess"? Are
3 you talking about long-term or short-term assessment?

4 Q. Long-term.

5 A. It would not be -- I think it's actually very
6 reasonable to assess, as Mr. Beach indicated, the
7 long-term value and benefits and costs of distributed
8 generation in the same way that APS evaluates, say,
9 energy efficiency and demand response resources, and the
10 way that it likely evaluates the cost effectiveness of
11 generating resources.

12 Q. I would like you to turn to page 29 of your
13 rebuttal testimony. Are you there?

14 A. Yes.

15 Q. Page 29 of your rebuttal testimony discusses
16 your recommended use of the peak capacity allocation
17 factors, or otherwise known as PCAFs; is that what you
18 would refer to those as?

19 A. Yes.

20 Q. Can you cite to any Arizona Corporation
21 Commission case that uses PCAFs as part of cost of
22 service ratemaking?

23 A. No.

24 Q. You do cite in your testimony to Pacific Gas &
25 Electric; is that correct?

1 A. Yes.

2 Q. And Pacific Gas & Electric Company serves
3 northern California; is that right?

4 A. Northern and central California, yes.

5 Q. Would you agree that northern and central
6 California have a different climate than the vast
7 majority of APS's service territory?

8 A. Yes.

9 Q. Would you agree that Pacific Gas & Electric's
10 air conditioning load wouldn't be the same as APS's air
11 conditioning load, for example?

12 A. For certain parts of the PG&E system, probably
13 Arizona is hotter than, say, the southern central valley
14 that PG&E serves, and so there could potentially be, you
15 know, more air conditioning in Arizona, in the APS
16 service territory than PG&E, yes.

17 Q. Would you agree that the PG&E system peak and
18 load shape differs from that of APS?

19 A. Yes.

20 Q. Would you also agree that different system and
21 load characteristics can justify the use of different
22 cost allocators from one utility to another?

23 A. I could see using, potentially using different
24 cost allocators, depending on, say -- yes, that's
25 correct.

1 Q. Thank you. On page 29 you describe PG&E's
2 approach to determine cost responsibility using the
3 PCAF, and then you state on page 30, line 1, "This
4 approach has been approved by the California Public
5 Utilities Commission."

6 Do you suggest in that portion of your testimony
7 that the Arizona Corporation Commission should deviate
8 from the way it historically uses cost allocation and
9 adopt the PCAF approach because that approach has been
10 adopted by the California Commission?

11 A. Adopt the use of the PCAF approach in what
12 context?

13 Q. Cost of service ratemaking.

14 A. This is not a cost of service proceeding, so I'm
15 not making that recommendation. However, in a general
16 rate case, such a recommendation might be made.

17 MS. GRABEL: I have no further questions. Thank
18 you.

19 ACALJ JIBILIAN: Mr. Heyman?
20

21 CROSS-EXAMINATION

22 BY MR. HEYMAN:

23 Q. Good afternoon, Mr. Monsen.

24 A. Good afternoon.

25 Q. I have to tell you that when your testimony said

1 that APS had met its burden and that its approach was
2 reasonable, I didn't have any questions. But the
3 insertion of the word "not" there did lead me to pull
4 out my questions. So I just have a few questions for
5 you.

6 A. Okay.

7 Q. As I understand what you did in your rebuttal
8 testimony is you took APS's cost of service study
9 methodology and you made adjustments as you felt were
10 appropriate; is that correct?

11 A. That's not quite right. I tried to use APS's
12 cost of service model, but was unable to do so because
13 the model that I received was not a working model; and
14 so what I ultimately did is I made adjustments to the
15 value credits that Mr. Snook developed. And then the
16 other thing that I did was, since again I couldn't use
17 your model to calculate cost of service for generation
18 distribution, primary distribution substations, I used a
19 simplified approach for allocating costs using the PCAF
20 approach that Mr. Beach developed.

21 Q. My question really didn't go to the model as
22 much as to the methodology. So let me ask you another
23 question that kind of gets to the same point.

24 If the Commission were to say, Mr. Monsen, we
25 are accepting your testimony, we're accepting your

1 recommendation, and we're going to implement that in the
2 next rate case. It would basically be the APS
3 methodology using its model as you modified it with your
4 adjustments. Wouldn't that be correct?

5 A. I don't think I've made a recommendation in this
6 proceeding to adopt a cost of service methodology.

7 Q. Well, but you did --

8 A. So I don't know why the Commission would adopt
9 something that I'm not recommending.

10 Q. When you filed your testimony, you did file it
11 as an advocate; isn't that correct? Because it's
12 rebuttal testimony. You didn't file any direct
13 testimony.

14 A. I did not file direct testimony, that's correct.

15 Q. Right. And in your testimony, as a matter of
16 fact, you state at page 2, lines 9 through 11, that your
17 testimony reviews APS's testimony related to the cost of
18 service studies for net energy metered customers in the
19 residential customer class; isn't that correct?

20 A. I reviewed APS's testimony, yes, that's correct.

21 Q. And then you also put forth some conclusions
22 that you've reached in your testimony, correct?

23 A. Yes, I put forth conclusions.

24 Q. And I'm assuming that the reason you put the
25 conclusions there is because you wanted the Commission

1 to accept them?

2 A. Yes, and my recommendations were to specifically
3 not make decisions or to make findings or conclusions in
4 this docket regarding cost of service modeling because
5 this is the inappropriate place. There's not enough
6 time for parties to really dig in and understand --

7 Q. That's helpful. So when you spend 20-something
8 pages of your testimony analyzing, presenting your
9 analysis of the APS model, the APS cost of service
10 methodology, you aren't saying, "Here is my analysis,
11 but, Commission, don't accept my conclusions"?

12 A. No, I'm saying the Commission should accept my
13 conclusions, which is this is not the appropriate place
14 to adopt assumptions and methodologies for cost of
15 service studies. That's one of my conclusions.

16 Q. And so you're not proposing a substitute
17 methodology that the Commission should accept in this
18 proceeding?

19 A. No, I'm proposing -- yes, that's correct. I'm
20 not proposing an alternate methodology. I'm proposing
21 that the Commission wait until a more appropriate venue
22 and docket where parties actually have a chance to look
23 at and understand the models that they've been provided
24 in response to discovery.

25 Q. Perfect. So I just want to make sure I'm

1 understanding you properly. The testimony that you have
2 that talks about the adjustments that you make, the
3 assumptions that you made, the criticisms you have of
4 what APS presented in this Commission, drives to the
5 point of "Commission, don't do anything with regard to
6 cost of service in this case"?

7 A. And, in addition to that, my section 3 of my
8 testimony --

9 Q. But does "and" mean yes? Yes, and?

10 A. Yes, and.

11 Q. Okay.

12 A. Yes, and. Section 3 of my testimony indicates
13 that a cost of service study is not the appropriate tool
14 for determining the value of solar. So a cost of
15 service study might present, might be a data point, but
16 it certainly shouldn't be the determinative factor in
17 deciding the value of solar, because that's inconsistent
18 with the way that other long-term resources are valued.

19 Q. This Commission has never rejected an APS cost
20 of service study because it did not properly evaluate
21 new generation resources; is that correct?

22 A. Could you say that again, please?

23 Q. Yeah, this Commission has never rejected a cost
24 of service study analysis that APS has presented to it
25 because it did not properly evaluate new generation

1 sources; is that correct?

2 A. I don't know.

3 Q. Okay. Well, at page 3 of your testimony, let's
4 go there for a second. Lines 15 through 17, you make an
5 interesting statement based upon what you've just said
6 is a lack of knowledge.

7 Let me just read to you what you're saying here
8 on page 3. "Since a COSS focuses on short-term cost
9 issues, it is not the proper tool for evaluating new
10 generation resources, whether they are traditional
11 utility scale projects or DG."

12 Now, when you said that, you're not aware of any
13 instance in which the Commission may have already taken
14 action on this and contradicted what you said or agreed
15 with what you said?

16 A. I am unaware of the Commission ever approving a
17 long-term generation resource based solely on a cost of
18 service study.

19 Q. The fact that you are testifying on behalf of
20 TASC, I'm going to presume -- and correct me if I'm
21 wrong -- means that TASC has adopted your testimony as
22 their position in this case. Do you know that to be
23 true?

24 A. I believe so, yes.

25 Q. Has anybody told you to the contrary?

1 A. Not that I've heard.

2 Q. Okay. Let's turn then to page 9 of your
3 testimony, lines 14 and 15, where you say, "There is no
4 question that NEM customers do not have delivered load
5 shapes that mimic those of the average residential
6 customer."

7 I assume that after all this has gone on in
8 today's testimony, the hearings that we've had today,
9 that's still your testimony and that's still TASC's
10 position?

11 A. Yes.

12 Q. Okay. What I would like to do is turn to page
13 33 and 34 of your rebuttal testimony, please. Starting
14 with the question and answer on line 12, the question
15 asks, "Have you estimated the impact of using the
16 revised credits, and the 4.99 percent ROR on the net
17 cost to serve NEM customers relative to collected
18 revenue?"

19 And your answer is, "Yes, I have estimated the
20 impacts on the portion of their cost to serve that the
21 NEM customers on energy rates pay in a couple of
22 different ways. Assuming a retail ROR of 8.07 percent
23 as APS has done, which as mentioned above, is
24 misrepresentative of the real world situation, but using
25 TASC's recommended credits, NEM customers on energy

1 rates pay 46 percent of their cost of service, as
2 opposed to 36 percent as APS has stated. However" --
3 and this is the part I want to focus on -- "if I correct
4 APS's revenue requirement to reflect its targeted 4.99
5 percent rate of return and then continue to use APS's
6 credits, NEM customers on energy rates pay 42 percent of
7 the cost to serve them. Using the same 4.99 percent ROR
8 assumption and using TASC's recommended credits results
9 in an increase to 58 percent."

10 That's still your testimony?

11 A. Yes, for a single year, that is my testimony.

12 Q. And so after all -- you're the last TASC
13 witness. You're the last witness in this proceeding, it
14 appears, unless we have some other witnesses come to
15 kind of sponsor some documents. After the several years
16 that the solar industry has requested a value of solar
17 proceeding, after all the tens of thousands of pages of
18 documents, after all the witnesses and the hours of
19 cross-examination, the best case that the value of solar
20 testimony has come up with from TASC is that 42 percent
21 of the cost to serve a NEM customer is not paid by a NEM
22 customer?

23 MR. RICH: Your Honor, I'm going to object to
24 the form of the question in that it assumed a lot of
25 things that are not in evidence at this point.

1 MR. HEYMAN: The 10,000 pages of discovery or
2 the hours -- I'm just asking from the standpoint --

3 MR. RICH: It was more of a history lesson than
4 a question. I'm happy to have you ask a question like
5 that, but you're testifying in that question.

6 MR. HEYMAN: Well, that wouldn't be a first in
7 the Commission.

8 ACALJ JIBILIAN: Could you ask the question in a
9 little bit shorter way?

10 MR. HEYMAN: Yes.

11 BY MR. HEYMAN:

12 Q. Your best testimony in this proceeding is that,
13 based upon your analysis as you've presented it to us,
14 NEM customers pay 42 percent of the cost to serve them?

15 A. My testimony says a number of things related to
16 your question. First, as I indicated, I was not able to
17 do an analysis of the cost of service for NEM customers
18 based on delivered load as I had hoped to do because I
19 was unable after much wrestling to try to get the APS
20 working model to actually calculate cost of service with
21 changed assumptions. That would have been my
22 preference, is to use that.

23 So instead of doing that, I fell back to the
24 approach that APS's witness Mr. Snook used, which is
25 let's use gross solar customer load in the cost of

1 service study, and then develop some credits. Okay?

2 But that isn't really even the most important
3 point. The most important point is that this is a
4 one-year snapshot based on a retrospective view of the
5 cost to serve APS's customers. It is not consistent
6 with any sort of resource planning that I've ever been
7 involved with. It's not consistent with any sort of
8 evaluation of long-term resources.

9 What this says is that if everything stays the
10 same today at this moment in time, using this method
11 that I hadn't really proposed to use, I can get to about
12 42 percent. But again, that's not the value of solar,
13 because the value of solar is a long-term resource that
14 has a long-term set of costs and benefits that change
15 over time. Therefore, to characterize my testimony as
16 saying that 42 percent is the value of solar is
17 completely incorrect.

18 Q. And thank you for that answer. I think you're
19 correcting a statement that was never made. So let me
20 just ask you your question.

21 Have you estimated the impact of using the
22 revised credits and a 4.99 percent ROR on the net cost
23 to serve NEM customers relative to collected revenue?
24 That has nothing to do with value. Could you just
25 answer that question?

1 A. For one year, yes.

2 Q. And the number is?

3 A. 42 percent, based on those assumptions.

4 Q. So if the Commission were to say, Mr. Monsen,
5 you win. We're going to take your testimony and we're
6 going to accept it, and we're going to find that today,
7 for one year, the NEM customers are able to pay for 42
8 percent of the costs to serve them, you would be happy?

9 A. In the same way that if you were to look at
10 the --

11 Q. Let me ask you the question this way.

12 A. Okay, yes, could you please.

13 Q. That was your testimony when you filed it on
14 April 7 of this year, what we read from pages 33 and 34?

15 A. Yes.

16 Q. And that's your testimony today?

17 A. Yes.

18 MR. HEYMAN: Okay. I have no further questions.
19 Thank you.

20 ACALJ JIBILIAN: Mr. Pozefsky?

21 MR. POZEFSKY: I have no questions, Your Honor.

22 ACALJ JIBILIAN: Ms. Scott?

23 MS. SCOTT: I have just a few.

24

25

1 CROSS-EXAMINATION

2 BY MS. SCOTT:

3 Q. Good afternoon, Mr. Monsen.

4 A. Good afternoon.

5 Q. The way I interpret your testimony, you're
6 saying that a cost of service study is a short-term
7 analysis of APS's costs, such as the analysis that's
8 performed in a rate case, correct?

9 A. That's correct.

10 Q. Okay. And you're also saying that you don't
11 believe that such an analysis is appropriate to
12 determine the value of solar?

13 A. In the same way as this Commission uses
14 long-term cost/benefit analyses to determine the value
15 of other demand-side resources and does not use a cost
16 of service study in that assessment, that's what I'm
17 saying, yes.

18 Q. Okay. So would you agree with me then, as a lot
19 of other parties to this proceeding, that the avoided
20 cost methodology would be one appropriate way to value
21 solar?

22 A. Yes.

23 Q. And you're suggesting that it should be a
24 long-term avoided cost determination; is that correct?

25 A. That seems reasonable to me, but the focus of my

1 testimony is really on the cost of service issues.

2 Q. Okay. Did you review the testimony of APS
3 witness Brad Albert?

4 A. He wasn't really dealing with cost of service
5 issues. I think I looked at it, but not in any depth.

6 Q. His was more on value of solar methodologies.

7 A. That's right.

8 Q. Okay. I have one other question. Do you
9 believe that cost of service study is appropriate,
10 however, to determine the cost shift?

11 A. A cost of service study can determine the
12 potential revenue and costs of service in a particular
13 year; and so if you're worrying about a potential cost
14 shift in a one-year period, then yes, you could say
15 that. However, as Mr. Beach discussed, if a resource
16 has long-run benefits greater than long-run costs, then
17 there's not a cost shift overall. But for a one-year
18 period, a cost of service study could answer that
19 question. That's why I said it's a data point, but it's
20 only a data point for a particular year.

21 Q. Okay. And I just want to make sure I understand
22 your position. So that if the cost of service study,
23 let's say -- and I'm going to use a hypothetical here.
24 APS used a cost of service study, its cost of service
25 study as it would in a rate case, and it determined that

1 for that historical test year, let's say there was a \$50
2 cost shift to nonparticipating customers.

3 Is that an appropriate evaluation, or are you
4 saying, on the other hand, that it has to also consider
5 the long-term benefits of solar?

6 A. It's appropriate -- the use of a cost of service
7 study would be appropriate to look at the current-day
8 cost to serve NEM customers and the potential short-run
9 benefits associated with those customers. However, that
10 would not give you a good estimate of the value of solar
11 over the life of the investment.

12 Q. So you're saying that the number produced by the
13 cost of service study has to be compared to the benefits
14 produced in a value of solar study? Is that what you're
15 saying?

16 A. No. I think what I'm saying is, if you were to
17 look at the annual benefits and costs of a long-term
18 value of solar study, looking at a cost of service study
19 might be like looking at the first year of those
20 benefits and costs. It might potentially be considered
21 that.

22 Does that answer your question?

23 Q. I'm not sure. I'm not sure. I guess so. I
24 guess it does.

25 Let me see. I think that --

1 MS. SCOTT: Your Honor, could I just look at his
2 testimony once more?

3 ACALJ JIBILIAN: Sure.

4 (A brief pause.)

5 MS. SCOTT: That's all I have. Thank you,
6 Mr. Monsen.

7 THE WITNESS: You're welcome.

8 ACALJ JIBILIAN: Do you have redirect, Mr. Rich?

9 MR. RICH: I do not, Your Honor.

10 ACALJ JIBILIAN: Thank you very much for your
11 testimony, Mr. Monsen.

12 THE WITNESS: You're welcome.

13 ACALJ JIBILIAN: You're excused.

14 I think we already discussed all our procedural
15 issues. Are there any more?

16 Yes, Mr. Loquvam.

17 MR. LOQUVAM: No issue. Only to note the
18 protective order filing has been made. It's in the
19 docket and waiting.

20 ACALJ JIBILIAN: And I will issue a procedural
21 order on that very quickly.

22 We will be back in this room on June 8 at 9:30
23 a.m. Thank you very much. I'll see you then.

24 (The hearing recessed at 4:10 p.m.)
